## Smart Linear Actuator Operating Software 1.9 User Manual

**SLA Operating Software (SLA OS)** is used to program DE-STA-CO Automation's Smart Linear Actuator electric slides. The SLA OS User manual explains the many features available in the software..

---

© 2004-2006 DE-STA-CO Automation. All rights reserved.

# New features summary

Following is a summary of the main features in each of the release.

## v1.9

- New Features
  - SLA OS is now compatible with the upcoming line of eCylinder (EC65, EC90) and eRotary (ER21, ER75) product line. As an end user, all the investment in learning the SLA OS software is preserved by the backward compatible changes. The virtual mode is also upgraded to gracefully handle the new product line.
  - When starting SLA OS application, there is an additional drop down menu for choosing an application profile. Current choices are
    1. Complete SLA OS (default) - this will allow to leverage full functionality of the software.
    2. eCylinder/eRotary Programming - this will result in a simple user interface geared towards BCD programming for eCylinder/eRotary.
  - Improved BCD programming has following new features
    1. A new BCD wizard provides choice of either creating a BCD program from scratch or from the existing collection of points.
    2. Adding, updating and deleting positions within the BCD programming screen itself
    3. Now it is possible to assign different speed, acceleration for each BCD point. Note that speed and acceleration are specified as percentage of maximum limits.
    4. Newly introduced Relative position mode (in addition to the present Absolute position mode) can be assigned to a point which results in incremental motion. This could be used in an application where PLC signal can move a slide/rotary by fixed distance/angle respectively.
  - Dynamic path creation capability for MMP programs can now also be used for creating curvilinear (arc) paths by assigning the dynamic path the pathType value of 2 (1 = linear (default), 2 = curvilinear) and adding 'start', 'center', 'end' and 'direction' points.
- SLA Commands
  - Included Calibration as a value that can be obtained using `sla.MotorStatus` command. This can be used to determine if a particular motor has been calibrated (homed) and to alert operator before proceeding to calibrate it.
- Miscellaneous
  - A new submenu from Diagnostics icon in toolbar allows releasing serial connection without closing the whole application. When needed, the connection can be reestablished by running the Diagnostics again.
  - Teach pendant has been enhanced to change the speed and acceleration as percentage of maximum values for each motor.
  - Dataset window now has status bar that shows useful information about datasets, paths and points. It also shows elapsed time in seconds for running a path to help in optimizing cycle times.
  - Unit Conversion calculator is enhanced to work with new eRotary motors for converting angles in degrees to Smart Motor Units.
  - Single axis representation is improved in Dataset window which also allows creating BCD points for one axis system by clicking on the graphical area.

## v1.8

- New Features
  - Added Wizards for automatically creating MMP programs for common tasks such as palletizing and glue dispensing. In the subsequent releases more wizards will be added to

- simplify all aspects of programming including template support where special templates will be created for speeding up everyday common programming tasks.
- Enhanced Dataset Path creation by adding functionality to copy, paste and insert a point anywhere within a path. Apart from the existing 'create point' and 'update point' modes, now there is an additional 'insert point' which can be enabled by pressing CTRL and clicking on any point. In the insert mode, a new point can be inserted anywhere within a path by selecting a point and creating a point in usual manner. To copy and paste a point, use CTRL+C (for copy) and CTRL+V (for paste) commands.
  - A new path that starts at the end of another path can be created by selecting the lead path and creating the new path. This works even when the lead path is an arc. This functionality is very useful while creating elaborate appended paths (e.g. for dispensing application).
  - New dynamic path creation capability of MMP programs allows constructing user defined linear paths at runtime. This is useful for creating paths based on user input or from values stored in external file.
  - Extended the arc manipulation CTRL command to adjust the end point of an arc to lie on the arc. To access this feature, select the end point, press CTRL and click anywhere on the graphical area. This will modify the end point's values so that it is on the arc now. This feature is useful for obtaining the start point for the next path in the appended chain of paths.
  - Created SMP debugging capability by having SMP programs use PRINT statements to print on the motor terminal. These statements can report the existing variable values as well as text messages for debug help.
  - Added capability to interface with DVT Vision System. The data obtained from the vision system can be used to drive the SLA system.
  - SLA OS software now comes bundled with plenty of useful sample programs and their associated databases to run out of box. These programs (both SMP and MMP) use recommended programming practices and can be extended to create custom programs. The programs are located in the samples directory under the installation directory.
  - Created additional log levels to use from within MMP programs. Currently supported log levels are
    - **0 (new)** can be used for logging messages which are not saved in the file.
    - **1** can be used for logging information messages. These messages are also saved in the log file.
    - **2** can be used for logging warning messages. These messages are also saved in the log file.
    - **3** can be used for logging error messages. These messages are also saved in the log file.
    - **4 (new)** can be used for logging messages which are displayed in a separate pop up window with bigger fonts. This is useful for monitoring the program's progress. These messages are not saved in the log file.
  - EXCEL Commands
    - Added new excel commands (excel.ReadFile, excel.GetValue) for reading Microsoft Excel files without a need for installing Excel on the computer. This allows additional means to control the behavior of a program depending on the data present in the file. Note that the first line of the file is ignored and the second row is treated as row one. Also, if a column has mixed types of data (e.g. numbers and text), this method of retrieval can return Null for the minority types of data and some registry settings need to be modified to get the correct results. Please see <http://support.microsoft.com/kb/194124/EN-US/> or contact technical support for additional help.
  - SLA Commands
    - Enhanced sla.WaitForStop command to raise an error if motor is stopped due to fault (e.g. limit switch or position error).

- Included MaxCurrent and MaxPositionError as two additional values that can be obtained and set using sla.MotorStatus command. This allows to control maximum torque that can be exerted and adjust the threshold when position error is flagged.
- VISION Commands
  - Added new vision commands (vision.connectDVT, vision.ProcessDVT, vision.GetDVTValue) for interfacing with DVT vision system. This extends the existing support for Cognex to include two of the most widely used vision systems in the industry.
- Miscellaneous
  - Enhanced SMP Development Environment with ability to open multiple SMP programs simultaneously, multi level undo/redo facility, enhanced syntax coloring, selecting fonts and additional toolbar buttons.
  - Ability to select COM1 to COM9 ports for SLA OS operation. Earlier it was restricted up to COM4. This feature is useful when using USB to Serial converter which can create higher numbered serial ports.
  - Enhanced calculator with ability to copy result and handle invalid inputs.

### v1.7.1

- New Features
  - Added an ability to create arc paths from the start, end and any other point on the arc. This augments the existing capability where start, end and the center points of an arc are required. This is very useful when the exact dimensions are not available. In this case, the three points can be updated by moving the slides to the three points of an actual part. To access this feature, first update the start and the end points. Then to calculate the center point automatically, press CTRL and any point on the arc. This will create the desired center point.

### v1.7

- New Features
  - Added Virtual Motors Simulation (VMS) functionality to run the software in simulation mode.
    - Very useful when the actual hardware is not yet available or for training without the need of actual hardware.
    - Up to six virtual motors can be selected and configured individually.
    - Visual and audio simulation along with the tracing functionality of dataset window can be used to visualize the physical system behavior.
    - Configure simple rules for input switches depending on the state of an output switch to simulate physical IO behavior.
    - Input switches can be operated from the Motor Monitor screen.
    - Currently the MMP programming mode is fully supported. The SMP and BCD programs can be written and debugged but can't be run at this time.
  - Added time conversion in the Unit Conversion Calculator. This can be used to get time in SMU units when writing SMP program.
- SERIAL Commands
  - Added new serial commands (serial.OpenPort, serial.WritePort, serial.ReadPort and serial.ClosePort) for reading and writing from a MMP program using serial.\* convention.
- Miscellaneous
  - Added validation for point, path and dataset naming convention. Now it checks that these names don't contain space or illegal characters.
  - Improved documentation with Macromedia Flash tutorials. Now it is even easier to learn the software by following the video tutorials accessible from the help menu.

## v1.6

- New Features
  - Added Position Data Import for AutoCad Exchange Format (DXF), Microsoft Excel (XLS) and Comma Separated Values (CSV) files.
  - Added capability to interface with Cognex Vision System. The data obtained from the vision system can be used to drive the SLA system.
  - Added Unit Conversion Calculator for converting position, velocity and acceleration to various units. The calculator takes into account the pitch and encoder counts of a motor for conversion.
  - BCD programming now supports in place editing, on-the-fly program generation and synchronization with the dataset view.
- SLA Commands
  - Modified `sla.WaitForStop` with `timeOut` parameter which allows to wait only for specified time period.
- Vision Commands
  - Introduced `vision.ConnectCognex`, `vision.ProcessCognex` and `vision.GetCognexValue` commands to support Cognex vision interface
- Miscellaneous
  - BCD programming can now contain 100 positions from earlier 50 positions limitation.
  - Added scroll bar for Teach Pendant to accommodate SLA configurations involving high number of motors.
  - Added client specific software customization feature to provide enhanced level of technical service.
  - Enhanced syntax coloring of SMP programs, added Save As functionality to save SMP program with different name, added functionality to detect changed SMP program and confirm saving when exiting.
  - 'Auto Brake' button is automatically disabled when servo is on.

## v1.5.1

- SLA Commands
  - Added the command `sla.RunDiagnostics` to reset the serial connection in the event of power cycle e.g. when an E-Stop button is pressed.
  - Added decelerate option to `sla.WaitForStop` and `sla.StopMotion` commands to control the velocity profile while stopping. Now by default, it decelerates to stop in contrast to sudden stop earlier.
- HMI Commands
  - Added decelerate option to `hmi.WaitForStop` command to control the velocity profile while stopping. Now by default, it decelerates to stop in contrast to sudden stop earlier.
- Miscellaneous
  - Now teach pendant takes into account the selected speed and acceleration when desired position is entered into the position textbox and return key is pressed. Earlier it used the default velocity and acceleration.

## v1.5

- SLA Commands
  - Added `sla.StopMotion`, `sla.DoPositionMove`, `sla.DoVelocityMove` commands
  - Added additional status values (Bd, Bs, Bu) that can be accessed using `sla.MotorStatus`
  - Modified `sla.WaitForStop` command. The modified command has the capability to block the execution of program till an input signal attains the specified value or the motion stops, whichever occurs first. The modified command is backward compatible.

- Modified `sla.CheckSwitch` command. The modified command can return the status of either input or output switch. Earlier it used to return the status of only input switch. The modified command is backward compatible.
- Command `sla.WaitForSwitch` now returns `True/False` depending on success or failure.
- Removed redundant `sla.MoveToPath` command. The same operation can be carried out using `sla.BeginningPathPoint` which returns the first point on the path and then using `DoLine` to move to the point.

---

Removal of the command can result in backward incompatibility. See the following example about suggestions for fixing the code to work with this and all future releases.

Replace

```
sla.MoveToPath(MyDataset.path1, 100, 1000)
```

with

```
sla.DoLine(sla.BeginningPathPoint(MyDataset.path1),  
100, 1000)
```

- 
- Removed redundant `sla.ShiftAxisToPoint` command. The same operation can be carried out using `sla.ShiftAxis` command (see below).

---

Removal of the command can result in backward incompatibility. See the following example about suggestions for fixing the code to work with this and all future releases.

Replace

```
sla.ShiftAxisToPoint(MyDataset.point1,  
isChainedVariable)
```

with

```
Dim pointVariable as Point  
Set pointVariable = MyDataset.point1  
sla.ShiftAxis(pointVariable.x,  
pointVariable.y, pointVariable.z, isChainedVariable)
```

- Removed sla.DoMotion command. Replaced with the new sla.DoVelocityMove command.

---

Removal of the command can result in backward incompatibility. See the following example about suggestions for fixing the code to work with this and all future releases.

Replace

```
sla.DoMotion(motorIndex, direction, speed,
acceleration, monitorMotorIndex, monitorInputSwitch ,
monitorInputSwitchStatus )
```

with

```
sla.DoVelocityMove(motorIndex, direction,
speed, acceleration)
```

```
sla.WaitForStop(motorIndex,
monitorMotorIndex, monitorInputSwitch ,
monitorInputSwitchStatus)
```

---

- HMI Commands
  - Added hmi.WaitForStop command which is similar to sla.WaitForStop command.
- Miscellaneous
  - Help can be accessed from Help menu or clicking 'F1' function key.
  - MMP Development environment saves and restores the selected fonts.
  - Fixed bug regarding zero grid dimensions which freezes the SLA OS software.
  - Provided new button on the monitor screen to turn on/off all Outputs for testing purpose.

### v1.4.1

- SLA Commands
    - Extended the sla.SetServoOff command to optionally turn off automatic brakes. This can be used to easily move the slides around with hands. Since turning the servo off and the brakes at the same time can lead to undesired motions (e.g. z slide falling down due to gravity), removed the option of applying the command to all motors. Now the command has to be applied to individual motor explicitly (see below).
- 

Removal of the option to apply the command to all motors (indicated by argument '0') can result in backward incompatibility. See the following example about suggestions for fixing the code to work with this and all future releases.

Replace

```
sla.setServoOff(0)
```

with

```
sla.setServoOff(1)
```

```
sla.setServoOff(2)
```

```
sla.setServoOff(3)
```

- 
- Extended the sla.Calibrate command to optionally provide user specified speed and acceleration to control the speed of homing.
  - HMI Commands
    - New command hmi.SaveIOs available through sla commands to make it possible to programmatically persist the Modbus data
    - New command hmi.WriteRegister and hmi.ReadRegister deals with individual 16 bits Modbus registers.

## v1.4

- SLA Commands
  - Added a new command sla.WaitForStop to wait for all motors to stop moving.
  - Enhanced sla.ElapsedTime function to also allow resetting the timer
  - Enhanced sla.DoMotion command to specify an input to monitor and stop the motion when the input has the specified state (1/0).
- DB Status - Since the new version allows any database to be used (chosen during the login), it is necessary to provide the information about which database is currently in used. Created and added the DB icon in the status bar for this purpose.
- Bug fixes
  - When an invalid IO is specified, now it gives more meaningful message instead of 'No response received' earlier
  - Introducing Point class in the Basic environment even if no points are defined.
  - Fixed validation error for RotateAxis which can specify rotation around z-axis even when z-axis is not present.

## v1.3

- Multiple Configuration
  - Ability to switch between different databases from Login window
  - Ability to configure batchDatabase from Configuration window
  - Ability to save current database under different name from Logout window
- Status Variables - The new command in SLA Basic environment makes available all the status variables for each of the motor. This gives flexibility in programming as well as monitoring.
- Persistent Modbus Data - Additional database table holds the value of Modbus data. This value is restored when the application restarts. The database migration feature is updated to update any old database to automatically detect and update with the new table structure.

### v1.2

- Enhanced Programming Environment - The enhanced environment for writing Basic programs offers most of the standard text editor (Save As, Find/Replace, ...) functionalities.
- Uninstall - Now it is possible to uninstall the application through Start menu. Earlier user had to go to Control Panel and Add/Remove programs to remove the application.
- Better File Management - Enhanced install detects the existing database files and doesn't overwrite them. Similarly, enhanced uninstall doesn't uninstall the important files.

### v1.1

- HMI - Incorporating industry standard Modbus protocol in the application to offer HMI device compatibility for industrial applications.

### v1.0

- Multitasking - This allows multiple \*.mmp (multi motor programs) to run at the same time. The immediate use of this feature is to use the supplied 'startup.mmp' program to stop/start any mmp program by switching on corresponding input.
- Three dimensional motion - The linear as well as curvilinear motion is extended to three dimensions. What this allows is to draw arcs/circles on any planes in space. Also, the addition of a 'pitch/rotations' allow a helical movement in any direction in space.
- Appending arbitrary paths - This allows making a very complex path made up of various linear and curvilinear motions and running the slides with a smooth motion along the complete path.
- Path calculation caching - Since calculating the points to send to motor for a given path is one of the most CPU intensive task, a new caching mechanism is integrated. This allows to reuse the calculations repeatedly, thus speeding up the program tremendously.
- Multi-pitch capability - The software can handle any combination of SLA slides (e.g. X-axis SLA-150, Y-axis SLA-120 and Z-axis SLA-90). This allows for much more flexible configuration. The software compensates for the difference in pitch ratios among the slides.
- State management - When a program crashes or computer loses power, we still need to maintain state across these events. The new saveState/getState/removeState sla functions provide this capability. The common use is to 'start from where left off' functionality. e.g. in a N1 X N2 grid if we are drilling/inking and program crashes when it has completed nth grid point, next time when the program starts, we would want to repeat the process for the first n points and start at n+1 th point. The state management makes this possible. Also, note that it has been enhanced so that it works across threads which allows multiple threads to communicate among themselves.
- Pre-defined MMP function library - There is a provision of providing pre-written functions (slaFunctions.mmp) which can be used in any mmp program. We also provide another file userFunctions.mmp which can be customized for the end user for use in their applications.
- Database migration - The database that holds the SLA data has a certain structure when the application is shipped. However, with the new database migration capability, when new features are added or there is a need to change the existing database structure (schema), it can be handled without having customer intervention.
- Profiling for time - With the introduction of StartTimer and ElapsedTimer functions in sla, it is very simple to keep track of more than one timers to do profiling (e.g. cycle time) study.
- Robust BCD auto generated programs - The new template for generating BCD programs has been greatly improved to make it a 'one-click-process' to create a BCD program.

# Contacting

## SITE LICENSE AGREEMENT

IMPORTANT-READ CAREFULLY: This DE-STA-CO Automation End-User License Agreement ("EULA") is a legal agreement between you (either an individual or a single entity) and DE-STA-CO Automation ("DE-STA-CO Automation") for the DE-STA-CO Automation Licensed Product identified as DE-STA-CO Automation SLA operating software ("LICENSED PRODUCT"). By installing, copying, or otherwise using the LICENSED PRODUCT, you agree to be bound by the terms of this EULA. If you do not agree to the terms of this EULA, you may not use the LICENSED PRODUCT.

In consideration of the mutual covenants that follow, Licensor and Licensee agree:

### 1. Definitions

a. *Licensed Product*. The term "Licensed Product" means the DE-STA-CO Automation SLA operating software.

b. *Authorized User(s)*. The term "Authorized User(s)" means any current employee of Licensee.

c. *Representative Authorized User(s)*. The term "Representative Authorized User(s)" means any Authorized User under the terms of this Agreement who secures a copy of the Licensed Product for use on a DE-STA-CO Automation SLA modular automation system. A Representative Authorized User is charged with the custody, supervision, control, and security of the copy of the Licensed Product which he or she receives from the Licensee. For purposes of this Agreement, a person acting as a Representative Authorized User is acting on behalf of Licensee.

d. *Local Network System(s)*. The term "Local Network System(s)" means multiple, interactive user terminals connected to a single-processing or a multi-processing microcomputing unit whereby the user of an interactive terminal does not have physical access to the physical storage medium containing a copy of the Licensed Product.

e. *Free-Standing Workstation(s)*. The term “Free-Standing Workstation(s)” means a self-contained microcomputing unit which is owned or leased by Licensee for the exclusive use of Licensee’s employees and for which Licensee has provided a copy of the Licensed Product.

## **2. License**

In accordance with the terms of this Agreement, Licensor grants to Licensee, and Licensee accepts from Licensor, a nonexclusive and nontransferable license to use the Licensed Product on the Local Network Systems and Free-Standing Workstations owned, leased, or operated by Licensee for use only by Authorized Users. The use of the Licensed Product and related documentation is expressly limited to use on the DE-STACO Automation SLA modular automation system.

## **3. Ownership of Licensed Product**

Licensor represents that it is, and on the date of delivery of Licensed Product will be, the sole owner and copyright holder of Licensed Product; that it has, and on the date of the delivery of the Licensed Product will have, the full right and authority to grant this license and that neither this license nor performance under this Agreement does or shall conflict with any other agreement or obligation to which Licensor is a party or by which it is bound.

## **4. Title to and Rights in Licensed Product**

a. *Proprietary Rights*. The Licensed Product and updates of the Licensed Product are proprietary to Licensor, and title to them remains in Licensor. All applicable common law and statutory rights in the Licensed Product and updates of the Licensed Product, including, but not limited to, rights in confidential and trade secret material, source code, object code, trademarks, service marks, patents, and copyrights, shall be and will remain the property of Licensor. Licensee shall have no right, title, or interest in such proprietary rights.

b. *Restrictions*. Licensee is prohibited from distributing, transferring possession of, or otherwise making available copies of the Licensed Product to any person not employed at the licensee’s place of business. Licensee and Representative Authorized

---

Users are prohibited from making any modifications, adaptations, enhancements, changes, or derivative works of the Licensed Product, and Licensee shall advise all Authorized Users that they are prohibited from making any modifications, adaptations, enhancements, changes, or derivative works of the Licensed Product.

## 5. Confidentiality

a. *No Decompilation or Disassembly.* Licensor represents and Licensee hereby acknowledges that the object code constituting the Licensed Product and updates of the Licensed Product which is embodied on magnetic storage media contains confidential and trade secret material which is not readily susceptible to reverse compilation or reverse assembly. Licensee and Representative Authorized Users shall not attempt to decompile or disassemble the object code of the Licensed Product or updates. Licensee further agrees that it will use its best efforts to prevent decompilation and disassembly of the object code of the Licensed Product and updates by Authorized Users by advising Authorized Users of the provisions of this Subsection and by immediately reporting to Licensor and halting any reverse compilation or reverse assembly of the Licensed Product or updates by any Authorized User of which Licensee has actual knowledge.

## 6. Technical Support

Licensor, at its sole expense, shall provide Licensee with support of a technical nature with respect to all aspects of the Licensed Product and updates to the Licensed Product including their installation and use.

## 7. User Manuals

a. *Access to Manuals.* Licensee acknowledges that the user manual is an integral part of the software, which makes up the Licensed Product and is necessary for the proper use and application of the Licensed Product and updates to the Licensed Product.

b. *No Right to Copy Manual.* The license granted in Section 2 of this Agreement does not include any right to copy the user manual for use with the Licensed Product. Licensee acknowledges and agrees to use its best efforts to advise Authorized Users that any duplication of the manual is unauthorized by this Agreement, is prohibited by law,

and constitutes an infringement of Licensor's copyright. Violation of any provision in this Section shall be the basis for the immediate termination of this Agreement.

## 8. Limited Warranty and Disclaimer of Liability

a. *Results Not Warranted.* Licensor has no control over the conditions under which Licensee and Authorized Users use the Licensed Product and updates and does not and cannot warrant the results obtained by such use.

b. *Limited Warranty.* In addition to warranting that it has the right to grant the license contained in this Agreement, Licensor warrants that the magnetic media on which the Licensed Product or an update is recorded and any user manual leased under the terms of this Agreement are free from defects in material and workmanship under normal use. Licensor further warrants that the Licensed Product and any update of the Licensed Product will perform substantially in accordance with the specifications found in the user manual in effect as of the date of this Agreement. The warranties contained in this Section are made for a period of ninety (90) days from the date on which the Licensed Product or update is delivered to Licensee or from the date on which a user manual is leased by Licensee.

c. *Limitations on Warranty.* Licensor does not warrant that the functions contained in the Licensed Product or in any update will meet the requirements of Licensee or Authorized Users or that the operation of the Licensed Product or update will be uninterrupted or error free. The warranty does not cover any copy of the Licensed Product or update or any user manual, which has been altered or changed in any way by Licensee or any Authorized User. Licensor is not responsible for problems caused by changes in or modifications to the operating characteristics of any computer hardware or operating system for which the Licensed Product or an update is procured, nor is Licensor responsible for problems which occur as a result of the use of the Licensed Product in conjunction with software or with hardware which is incompatible with the operating system for which the Licensed Product is being procured.

d. *Exclusion of Implied Warranties.* ANY IMPLIED WARRANTIES, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, ARE EXPRESSLY EXCLUDED.

a. *Exclusion of Any Other Warranties.* The warranties contained in Subsection b of this Section are made in lieu of all other express warranties, whether oral or written. Only

an authorized officer of Licensor may make modifications to this warranty or additional warranties binding on Licensor, and such modifications or additional warranties must be in writing. Accordingly, additional statements such as those made in advertising or presentations, whether oral or written, do not constitute warranties by Licensor and should not be relied upon as such.

## 11. Limitation of Remedies

a. *Replacement Sole Remedy.* Subject to Section 22 of this Agreement, Licensor's entire liability and Licensee's exclusive remedy shall be the replacement by Licensor of any magnetic media or user manual not meeting Licensor's "Limited Warranty." In addition, while in no sense warranting that the operation of the Licensed Product will be uninterrupted or error free, Licensor will, as provided in Section 7 of this Agreement, assist the Licensee in the installation and maintenance of the Licensed Product and will supply the Key Person with corrected versions of the Licensed Product through updates.

b. *Damages Limitation.* LICENSOR DISCLAIMS ANY AND ALL LIABILITY FOR SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES (INCLUDING LOSS OF PROFIT) ARISING OUT OF THIS AGREEMENT OR WITH RESPECT TO THE INSTALLATION, USE, OPERATION, OR SUPPORT OF THE LICENSED PRODUCT OR ANY UPDATE OF THE LICENSED PRODUCT EVEN IF LICENSOR HAS BEEN APPRISED OF THE POSSIBILITY OF SUCH DAMAGES.

c. *Limitation of Any Recover,'* Subject to Section 22 of this Agreement, Licensee specifically agrees that any liability on the part of Licensor arising from breach of warranty, breach of contract negligence, strict liability in tort, or any other legal theory shall not exceed amounts paid by Licensee in fees for the use and maintenance of the Licensed Product.

## 12. Relationship of the Parties

For purposes of this Agreement, Licensee is not an agent of Licensor, and Licensee has no express or implied authority to act on behalf of or make any representations whatsoever on behalf of Licensor. Licensor has no right to control any activities of Licensee outside the terms of this Agreement.

### **13. Updates**

Updates include enhancements and corrections of and modifications and additions to the Licensed Product. Updates also include later versions of the Licensed Product. Use of updates with or in place of the Licensed Product shall be fully governed by and subject to the terms of this Agreement relating to the reproduction and use of the Licensed Product. Any portion of the Licensed Product replaced by an update shall be destroyed.

### **14. Supplements**

From time to time, Licensor will make available computer programs which are compatible with the

Licensed Product and which supplement the Licensed Product. SUPPLEMENTS ARE NOT

LICENSED UNDER THE TERMS OF THIS AGREEMENT.

### **15. Indemnity**

Licensor, at its own expense, will defend any action brought against Licensee to the extent that it is based on, or a claim that the Licensed Product or any update of the Licensed Product used within the scope of this Agreement infringes any patent, copyright, license, trade secret, or other proprietary right, provided that Licensor is immediately notified in writing of such a claim. Licensor shall have the right to control the defense of all such claims, lawsuits, and other proceedings. In no event shall Licensee settle any such claim, lawsuit, or proceeding without Licensor's prior written approval. Licensor shall have no liability for any claim under this Section if a claim for patent, copyright, license, or trade secret infringement is based on the use of a superseded or altered version of the Licensed Product if such infringement would have been avoided by use of the latest unaltered version of the Licensed Product available as an update.

### **16. Arbitration**

Except for the right of either party to apply to a court of competent jurisdiction for a temporary restraining order, a preliminary injunction, or other equitable relief to preserve

the status quo or prevent irreparable harm, any controversy or claim arising out of or relating to this Agreement or to its breach shall be settled by an arbitration administered by the American Arbitration Association and pursuant to its rules, and judgment upon the award rendered in such arbitration may be entered in any court of competent jurisdiction.

## 17. General

a. *Complete Agreement; Amendment.* Each party acknowledges that it has read this Agreement and any exhibit, understands them, and agrees to be bound by their terms, and further agrees that they are the complete and exclusive statement of the agreement between the parties which supersedes and merges all prior proposals, understandings, and all other agreements, oral and written, between the parties relating to this Agreement. This Agreement may not be modified or altered except by written instrument duly executed by both parties.

b. *Purchase Order.* In the event of any conflict between the terms and conditions of this Agreement and the terms and conditions of any purchase order, the terms and conditions of this Agreement shall control.

c. *Governing Laws.* The laws of the State of Texas shall govern this Agreement and performance under this Agreement

d. *Limitations Period.* No action, regardless of form, arising out of this Agreement may be brought by Licensee more than two (2) years after the cause of action has arisen.

e. *Severability.* If any provision of this Agreement is invalid under any applicable statute or rule of law, it is to that extent to be deemed omitted. The remainder of the Agreement shall be valid and enforceable to the maximum extent possible.

f. *Assignment.* Licensee may not assign or sublicense, without the prior written consent of Licensor, its rights, duties, or obligations under this Agreement to any person or entity, in whole or in part.

g. *Assumption by Successor to Licensor.* In the event of the acquisition of Licensor's business, software, or both by a third party, Licensor agrees to make such an acquisition subject to the assumption of the terms of this Agreement by the third party.

h. *Cessation of Business.* Should Licensor cease doing business for reasons other than the acquisition of the business or software by a third party, the license granted in Section 2 of this Agreement shall become a perpetual, nonexclusive, nontransferable license. The provisions of Sections 5 and 6 of this Agreement shall apply fully to such a license.

j. *Waiver.* The waiver or failure of Licensor to exercise in any respect any right provided for in this Agreement shall not be deemed a waiver of any further right under this Agreement.

k. *Headings.* The headings appearing at the beginning of the several sections contained in this Agreement have been inserted for identification and reference purposes only and shall not be used in the construction and interpretation of this Agreement.

## Technical Support

Please note that currently supported platforms for the software are Windows NT, Windows 2000, and Windows XP. Other older platforms (Windows 98, Windows 95) might work but are not supported.

The latest release is available from: <http://www.robohandsla.com/software/setup.zip>. To obtain an earlier release, please contact us.

If you need any technical support for installation or using the SLA OS, please contact DE-STA-CO Automation at the following information.

DE-STA-CO Automation  
3305 Wiley Post  
Carrollton, TX 75006  
[tech-sla@robohand.com](mailto:tech-sla@robohand.com)

(800)-259-9890 / 972-726-7300

# Quick Start

## Quick Introduction to Configuration of SLA OS

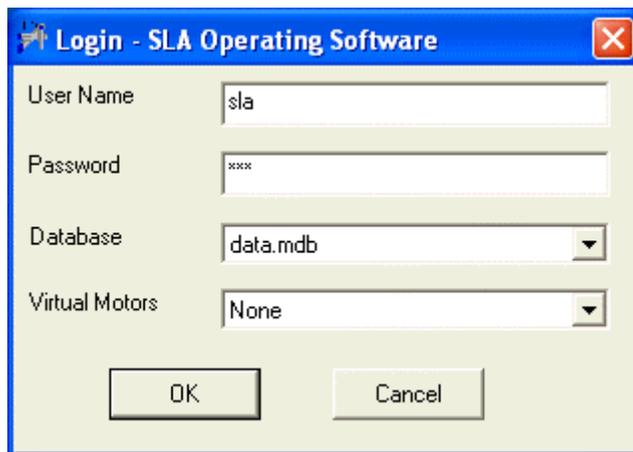

This section is designed for a quick introduction to the SLA OS by showing how easy it is to write useful programs to get the results you want. It shows examples of three different types of programs:

1. **Multi Motor Program (MMP)** - can handle most applications with its inbuilt library of highly sophisticated commands. It runs from the (optional) SLA Control Unit.
2. **Smart Motor Program (SMP)** - runs in the motors (doesn't require SLA Control Unit) and can handle many of the less complex tasks.
3. **Binary Coded Decimal Program (BCD)** - type of simplified SMP program where PLC based controls can be used to send BCD numbers to the motors to go to pre programmed locations.

Before a program can be written the SLA OS software must be configured to match the settings of the slides configuration.

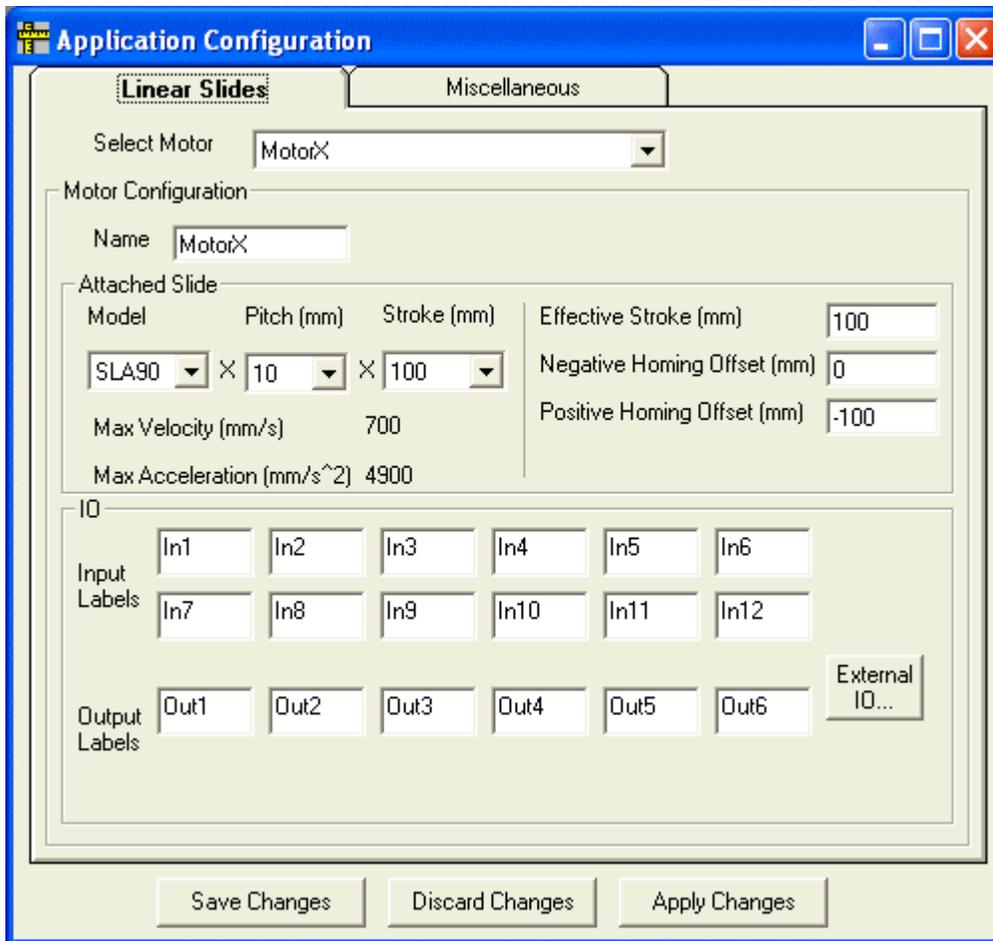

### Quick Configuration

Once the SLA OS software is installed (it already comes pre-installed if you also ordered the SLA Control Unit), login with the user and password both as "sla" (in lowercase).

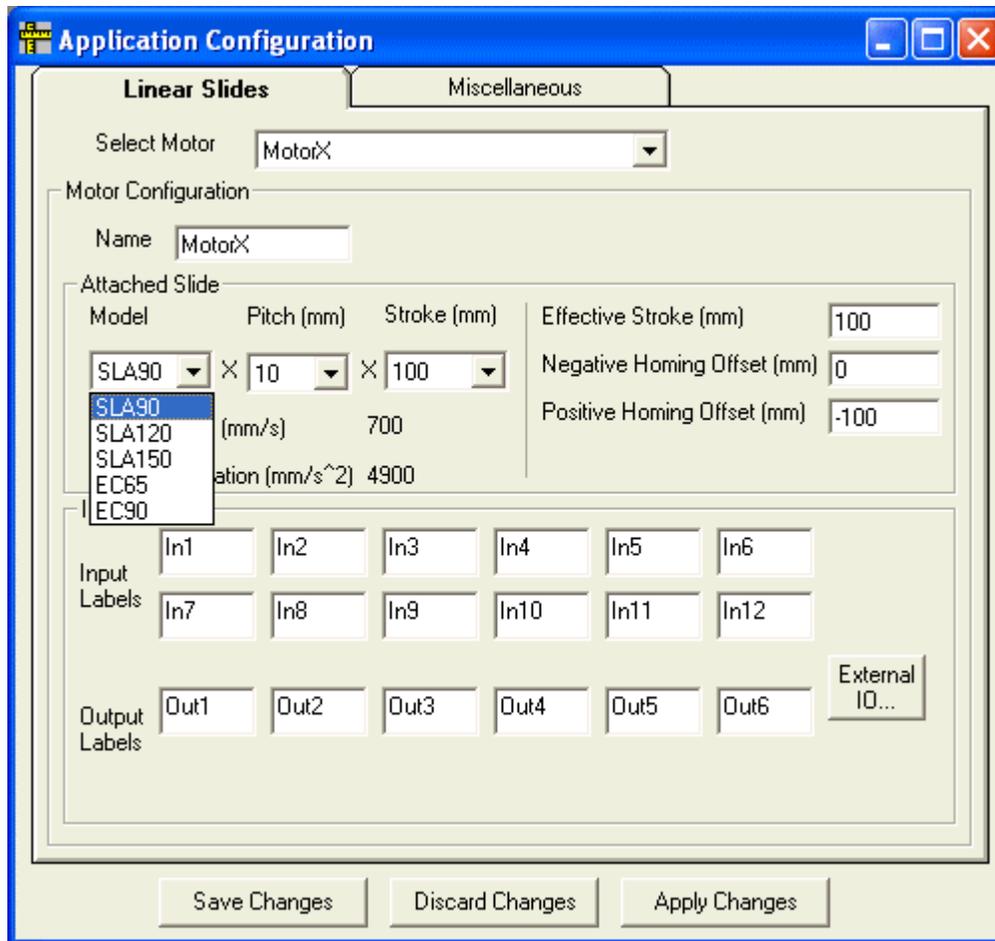

The image shows a Windows-style dialog box titled "Login - SLA Operating Software". It has a blue title bar with a close button (X) on the right. The dialog contains four input fields: "User Name" with the text "sla", "Password" with "xxxx", "Database" with "data.mdb", and "Virtual Motors" with "None". Below the input fields are two buttons: "OK" and "Cancel".

Click on the Configuration icon in the toolbar to open the following configuration screen.

Select the correct slide models and stroke lengths for each of the motors by clicking on the appropriate drop down combobox and saving the settings.

Once the system is configured, the following three sections show how to quickly write programs using the three mentioned program types.

1. [Multi Motor Program \(MMP\) Quick Start](#)
2. [Smart Motor Program \(SMP\) Quick Start](#)
3. [Binary Coded Decimal Program \(BCD\) Quick Start](#)

Later in the manual many of the advanced features will be discussed in more details to fully harness the power of SLA OS.

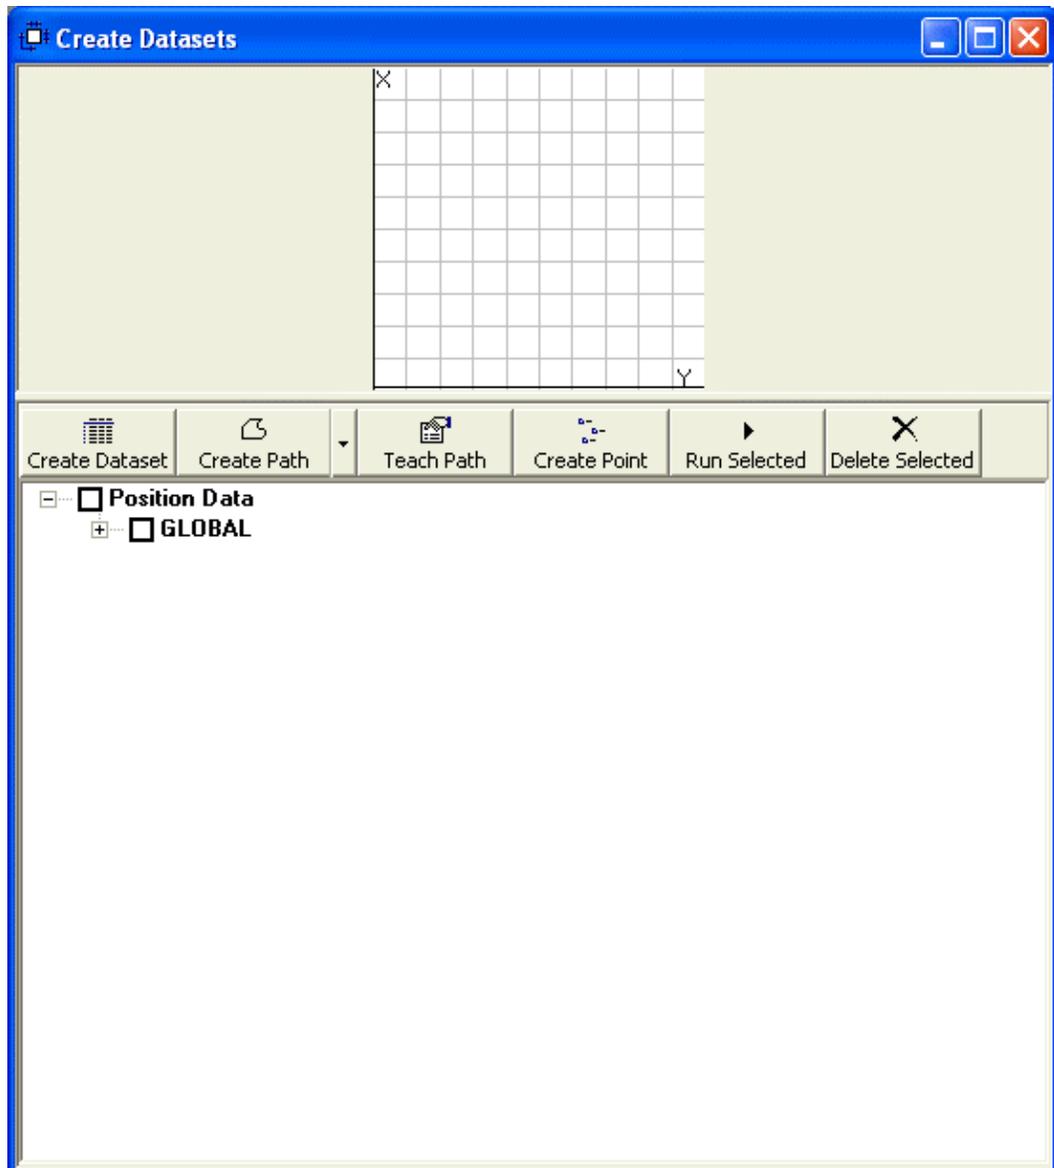

## Quick Introduction to Multi Motor Programming with SLA OS

This section is designed for a quick introduction to Multi Motor Programming with SLA OS by writing a simple Multi Motor Program (MMP) for dispensing along a square shape of 60 mm side with rounded corners of radius 5 mm. The three main steps are

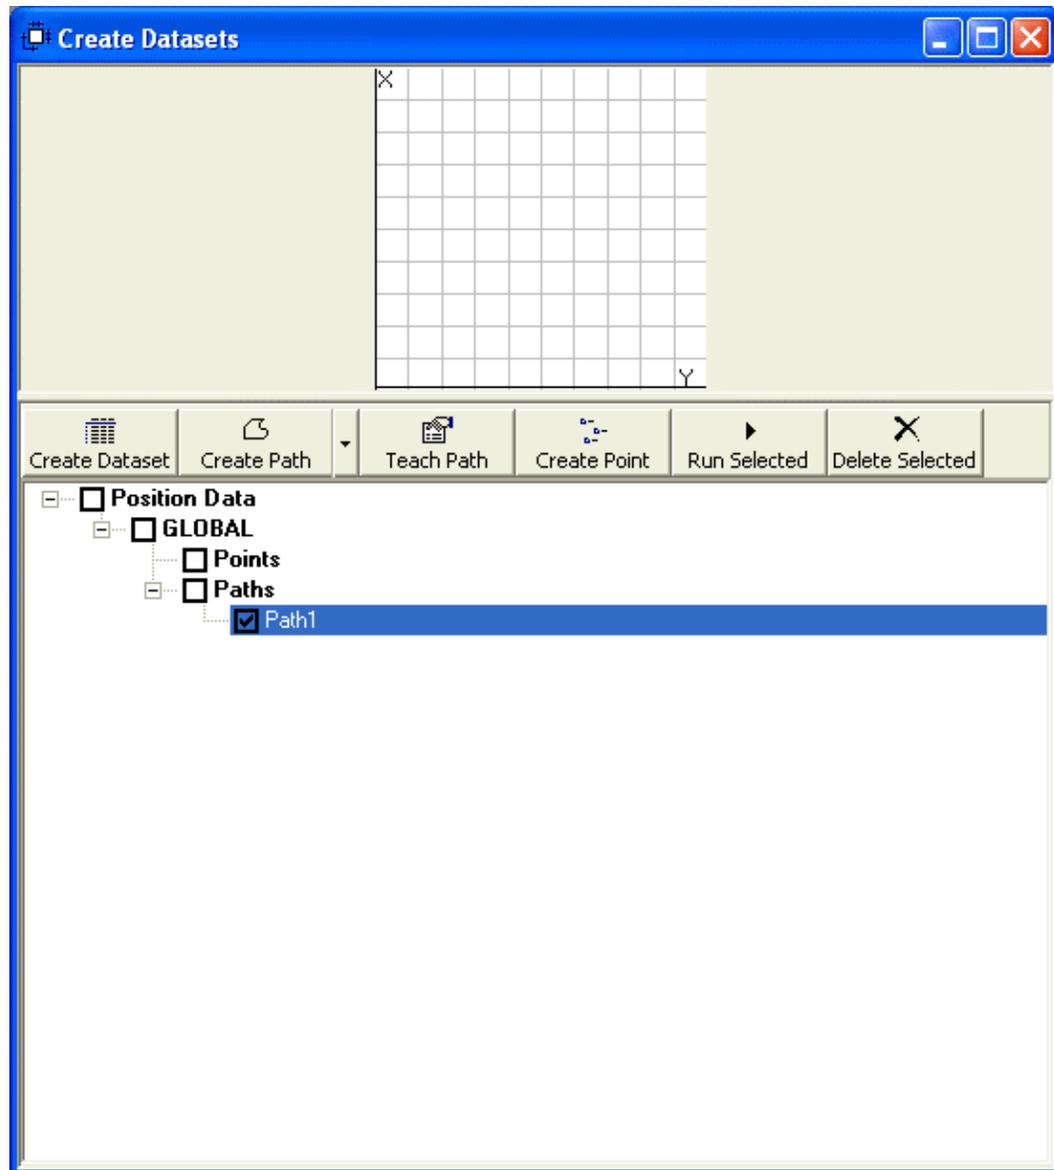

1. Position Data Creation
2. Programming
3. Results

### Quick Position Data Creation

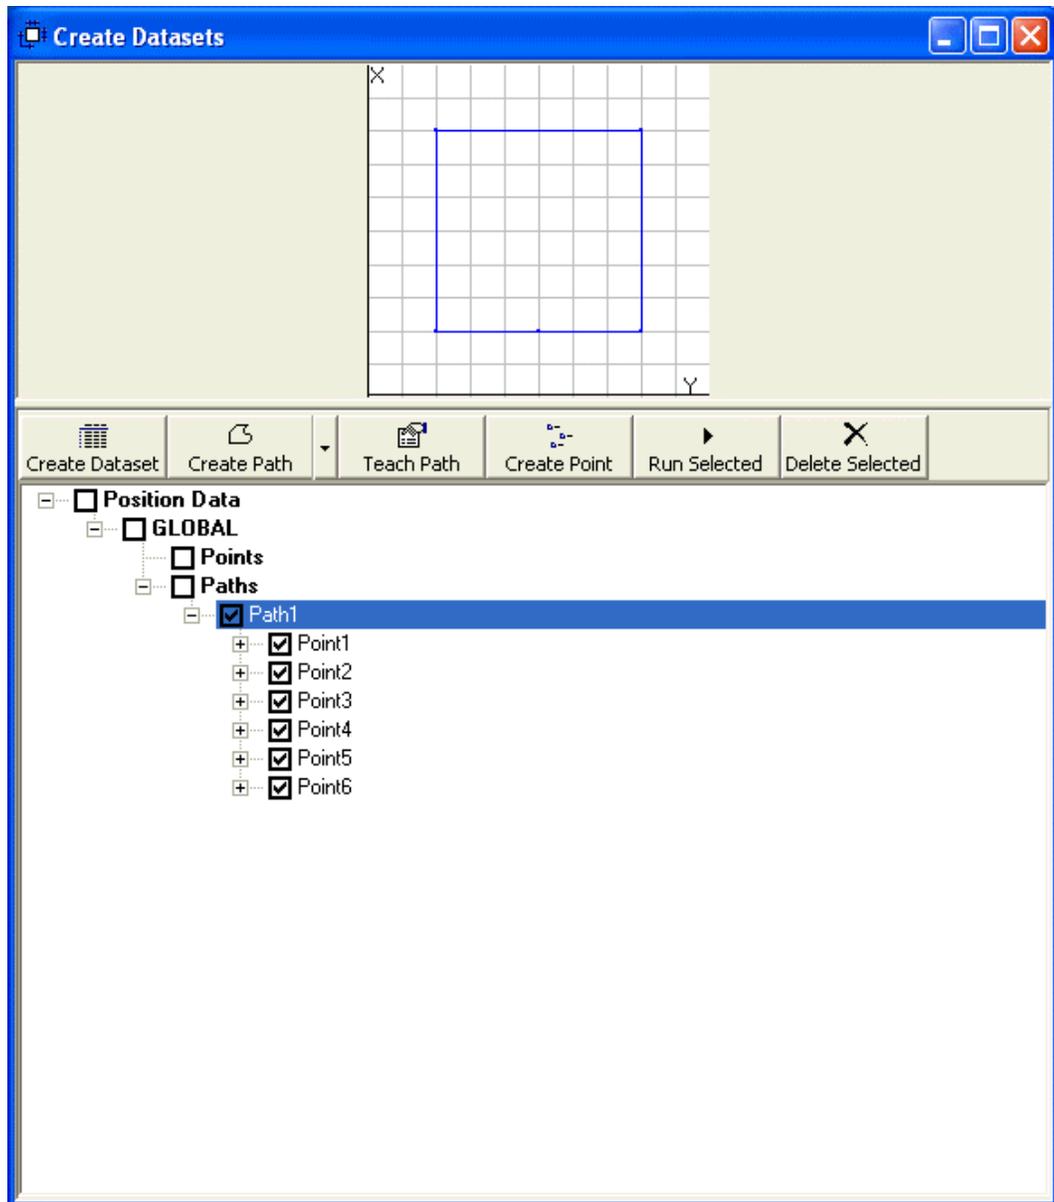

Click on the Datasets icon in the toolbar to open 'Create Datasets' screen.

Click on the 'Create Path' icon in the screen to create a new path for dispensing.

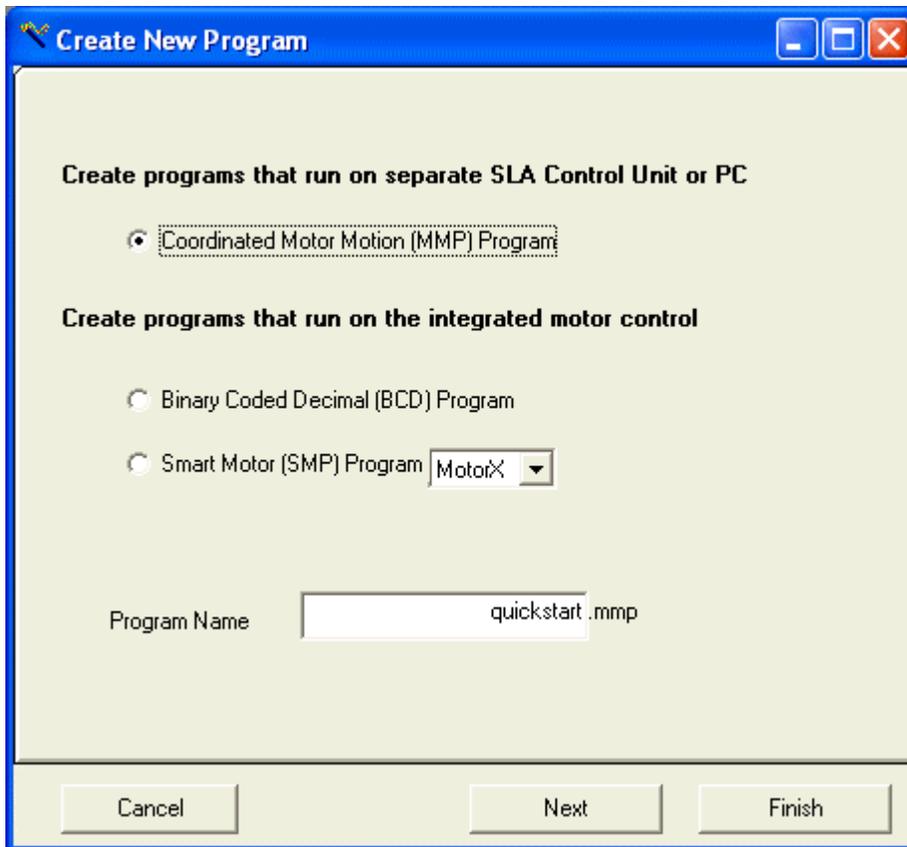

With the mouse, create the desired path as shown below. The six point square includes starting from the center of a side and selecting all four corners and back to the original center point to create six points as shown below.

## Quick Programming

Open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). By default, the MMP program is selected. Type the name of the new program in 'Program Name' textbox and click 'Create Program' button.

This will bring up the MMP Programming Environment with the template of the program already created as shown below.

```

=====
=====SLA Common Functions=====
'#USES "D:\work\apps\sla\src\sla\programs\slaFunctions.mmp"
'#USES "D:\work\apps\sla\src\sla\programs\userFunctions.mmp"

=====
=====SLA Multi Motor Program=====
=====

Sub Main
On Error GoTo HandleError:
    init

    Exit Sub
HandleError:
    sla.LogMessage "Got error ->" & Err.Description, 3
End Sub

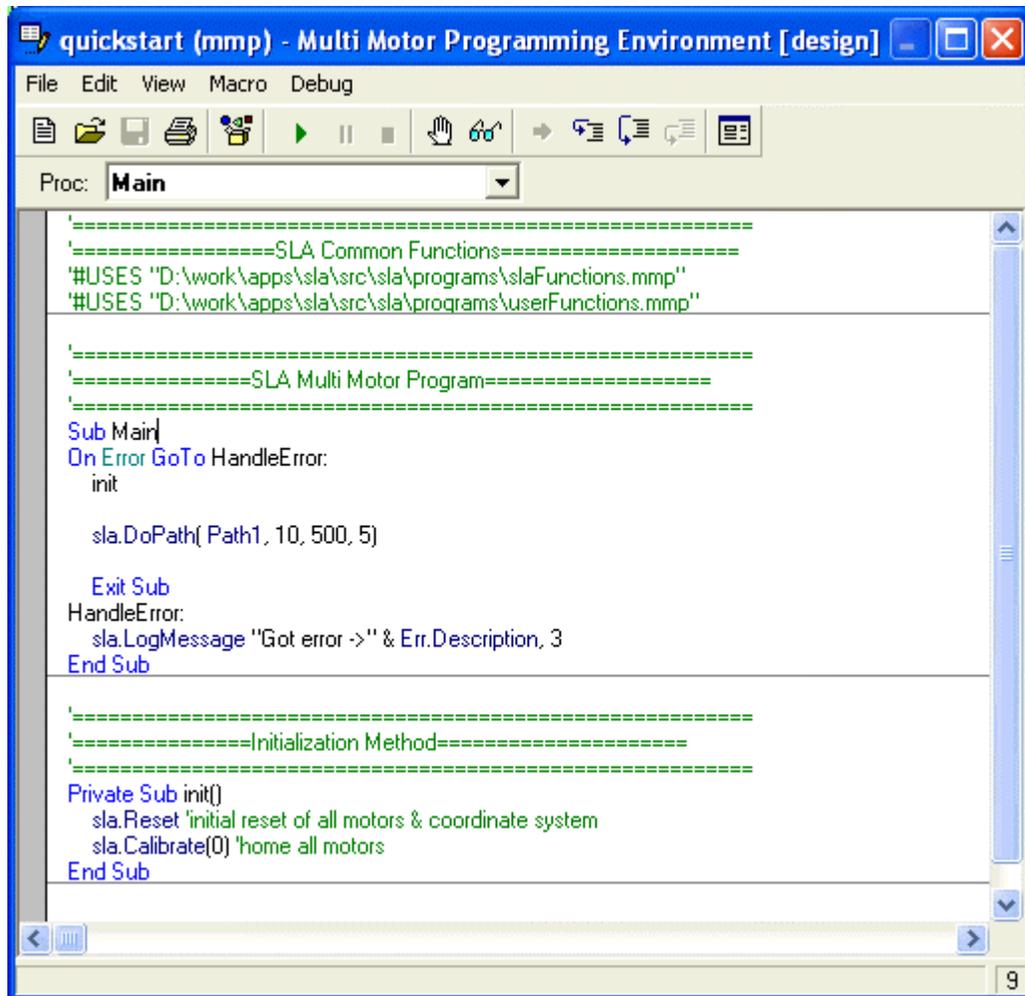

=====
=====Initialization Method=====
=====

Private Sub init()
    sla.Reset 'initial reset of all motors & coordinate system
    sla.Calibrate(0) 'home all motors
End Sub

```

Just after the 'init' call to calibrate the system, add the following line to make the slide follow the square path (Path1) just created. Note that as soon as you start typing 'sla.' the autocomplete feature of the environment displays all the possible completion. At this point it is a matter of selecting from the options and filling in the arguments. The following command will make slide follow the Path1 with 10 mm/sec. speed and acceleration of 500 mm/sec.<sup>2</sup>. Note, how easy it is to add the rounding of 5 mm for the corners.

```
sla.DoPath( Path1, 10, 500, 5)
```

```
'=====SLA Common Functions=====
'#USES "D:\work\apps\sla\src\sla\programs\slaFunctions.mmp"
'#USES "D:\work\apps\sla\src\sla\programs\userFunctions.mmp"

'=====SLA Multi Motor Program=====

Sub Main
On Error GoTo HandleError:
    init

    sla.DoPath( Path1, 10, 500, 5)

    Exit Sub
HandleError:
    sla.LogMessage "Got error ->" & Err.Description, 3
End Sub

'=====Initialization Method=====

Private Sub init()
    sla.Reset 'initial reset of all motors & coordinate system
    sla.Calibrate(0) 'home all motors
End Sub
```

## Quick Results

Select the 'Monitor All' and 'Visual Trace' checkboxes on the main window to follow the movement of the slides on the Dataset screen. Click the Start button on the MMP Programming Environment to run the program to see the following successful result.

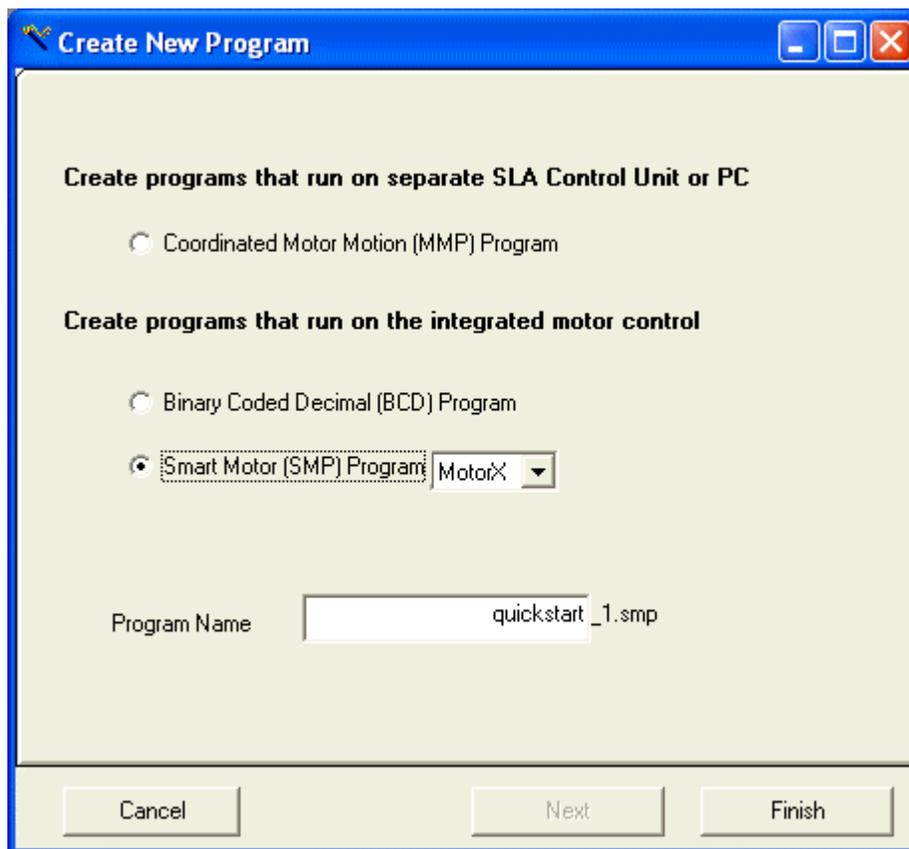

## Quick Introduction to Smart Motor Programming with SLA OS

This section is designed for a quick introduction to Smart Motor Programming with SLA OS by writing a simple Smart Motor Program (SMP) for creating a constant velocity motion of for MotorX in positive direction. The two main steps are

1. Programming
2. Results

### Quick Programming

Open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). Select the SMP program type and enter the name of the new program in 'Program Name' textbox. Note that by default, MotorX is selected. Click 'Create Program' button.

This will bring up the SMP Programming Environment with the template of the program already created as shown below which includes the instructions for downloading tuning parameters and homing the motor at the start of the program.

MV

A = 100

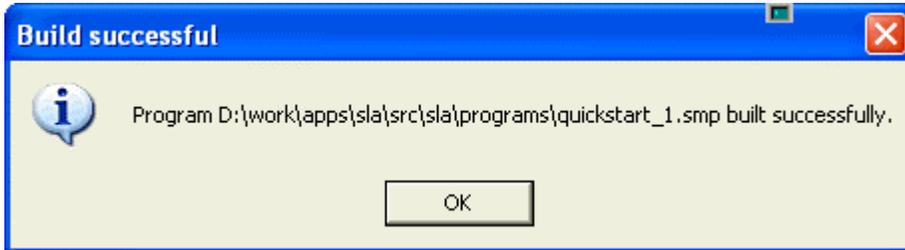

V = 1000000

G

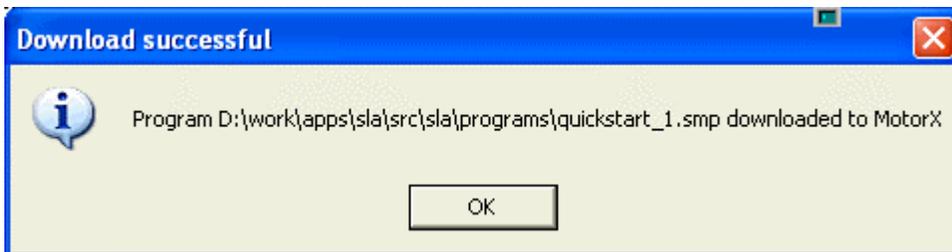

## Quick Results

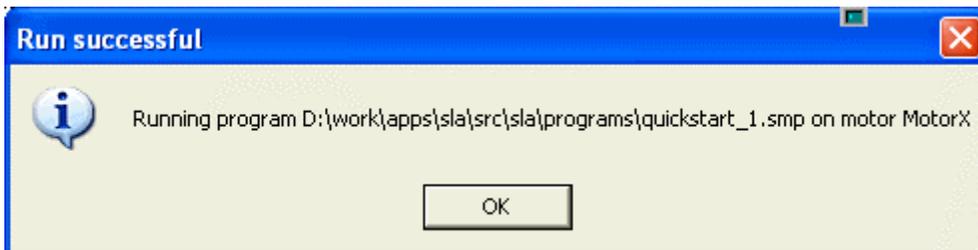

Before you can run the program, first build the program by clicking on the 'Build the Smart Motor Program' button in the toolbar. You should see the following confirmation to make sure that the program compiles successfully.

Next step is to download the compiled program to motor. Click on the 'Transfer Program from PC to Motor' button in the toolbar. You should see the following confirmation dialog box.

Now, to run the program, click on the 'Run' button. This will result in the downloaded programs running in the destination MotorX. By default, the generated programs run the homing routine initially. This behavior can be changed by modifying the program and rebuilding and downloading again.

The slide will move in the positive X direction and come to stop at the limit switch at the end of the slide.

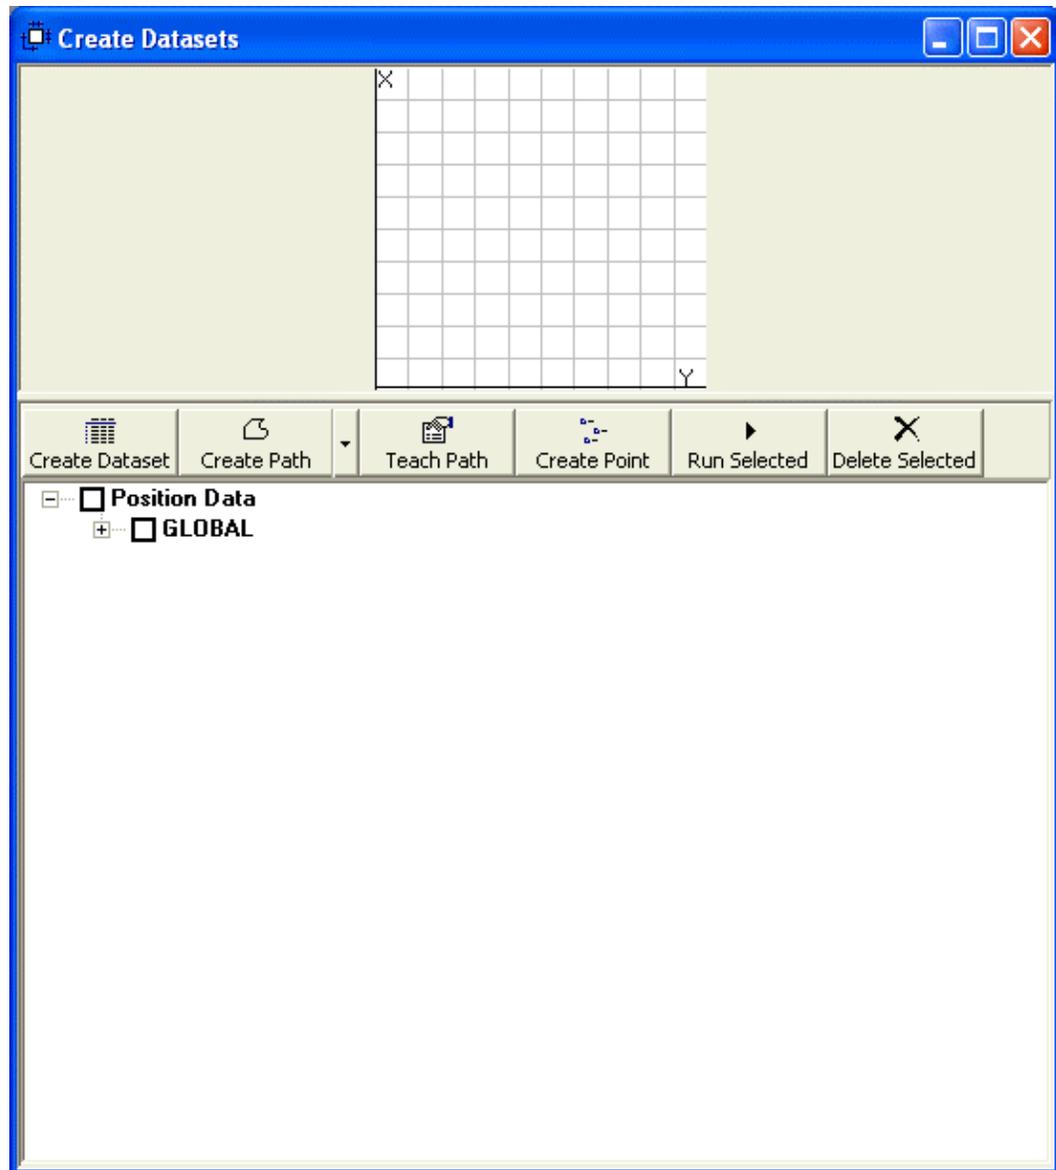

## Quick Introduction to Binary Coded Decimal Programming with SLA OS

This section is designed for a quick introduction to Binary Coded Decimal Programming with SLA OS by writing a simple Binary Coded Decimal Program (BCD) for generating series of positions to move. The three main steps are

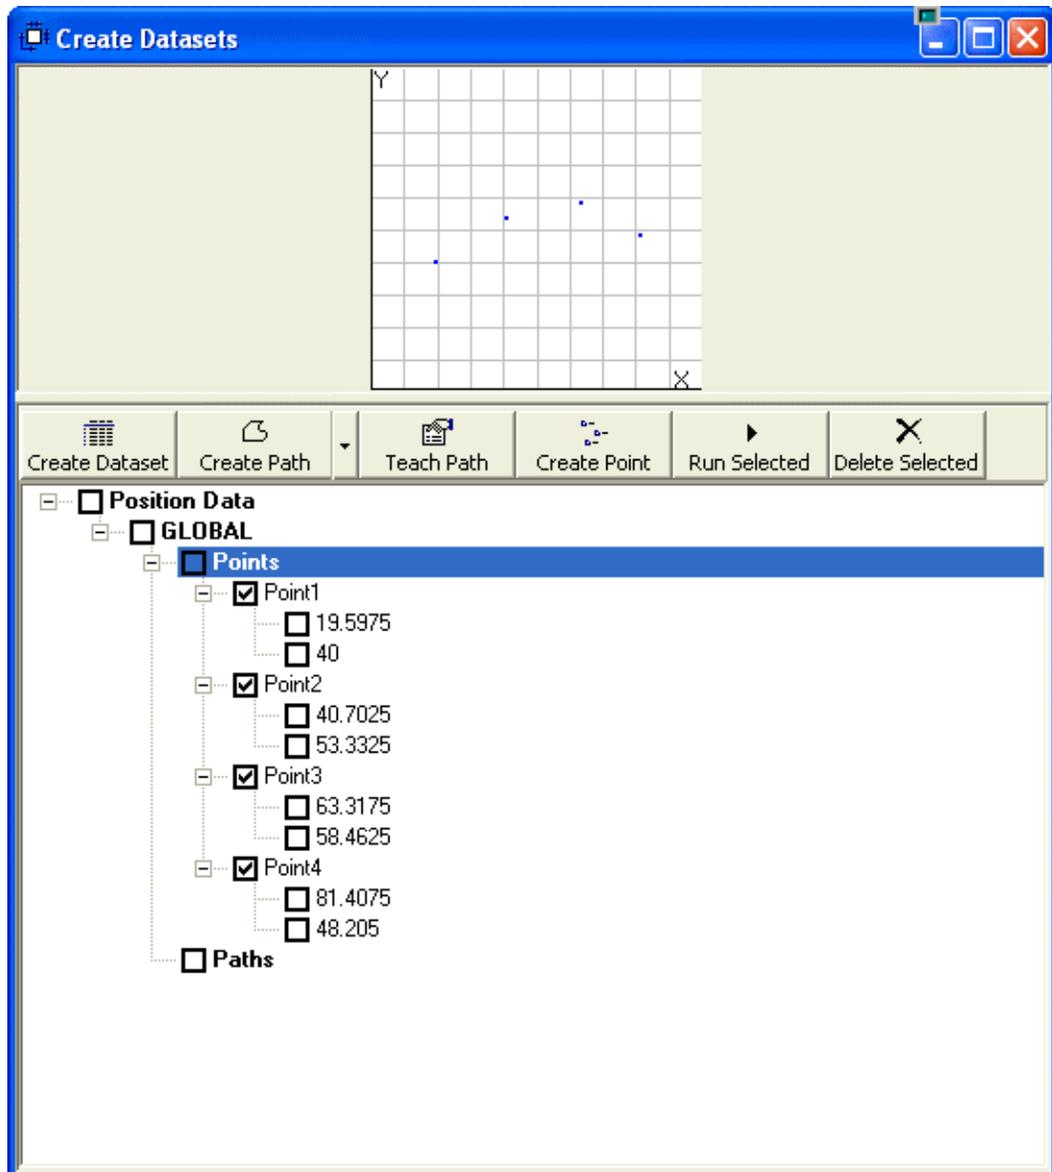

1. Position Data Creation
2. Programming
3. Results

### Quick Position Data Creation

Click on the Datasets icon in the toolbar to open 'Create Datasets' screen.

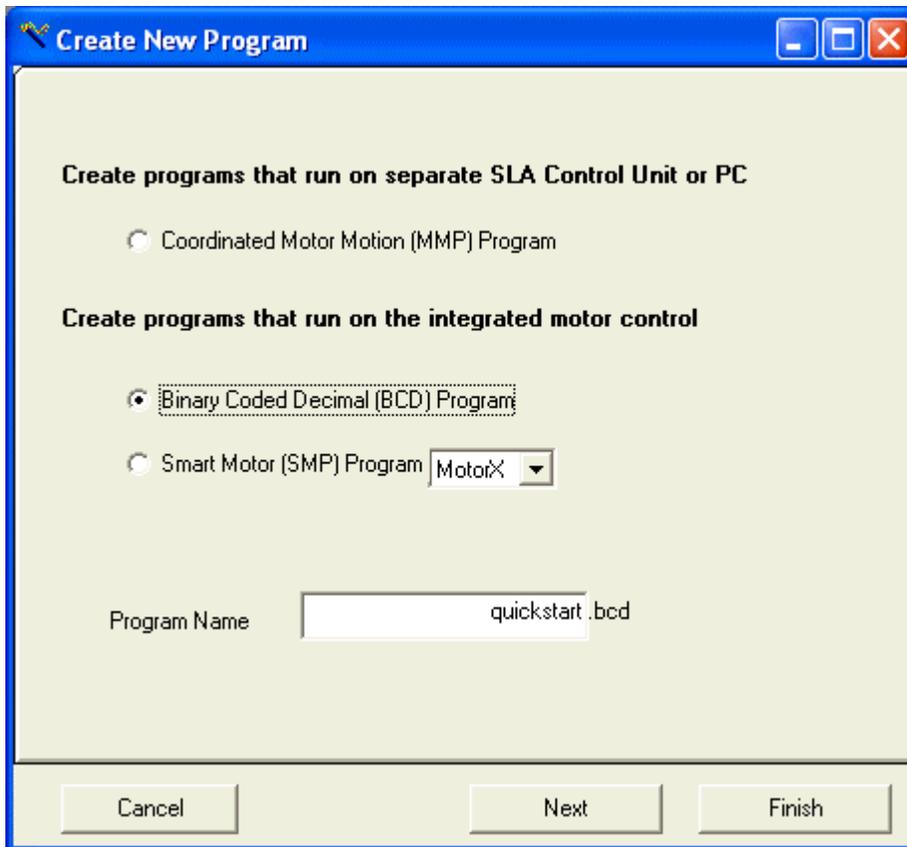

With the mouse, click on the screen to create the positions corresponding to the BCD input. With each click, a new point is added to the Points node as shown below. Since this is just for the test purpose, the exact locations of the points don't matter.

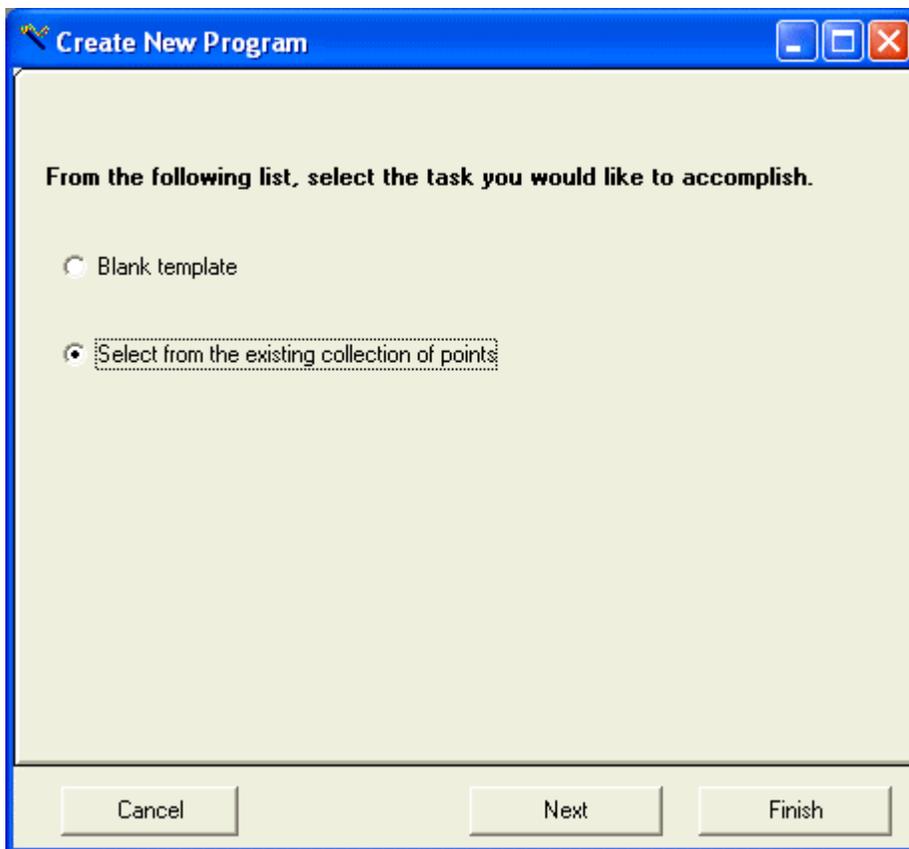

## Quick Programming

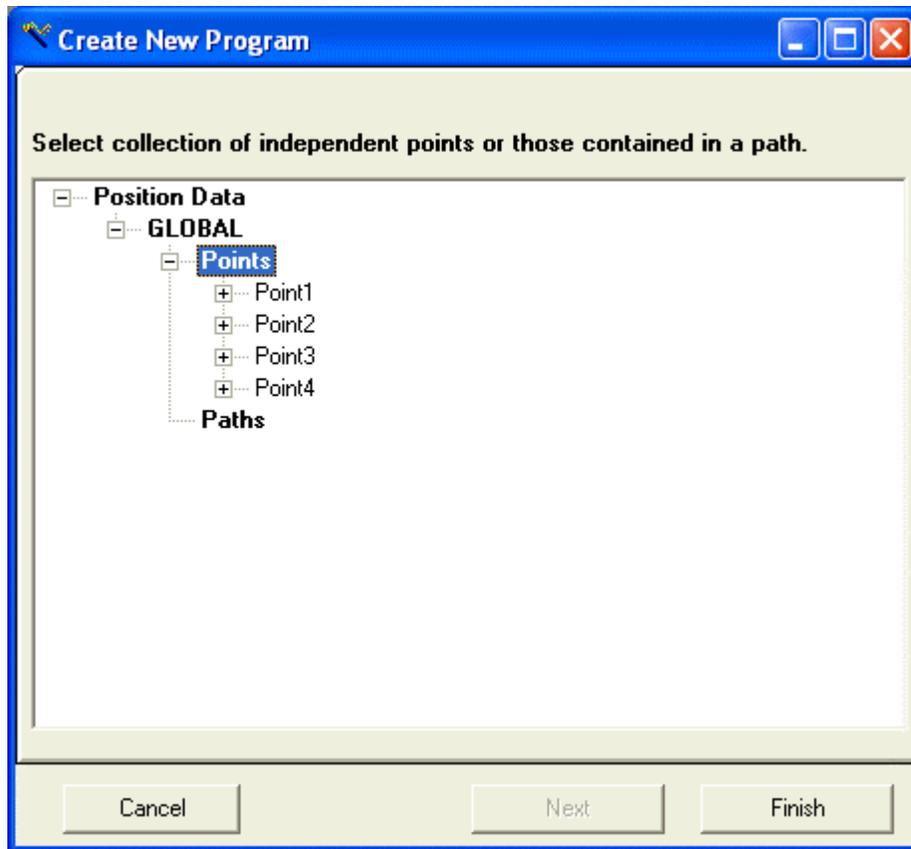

Open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). Select the BCD program type and enter the name of the new program in 'Program Name' textbox. Click 'Next' button.

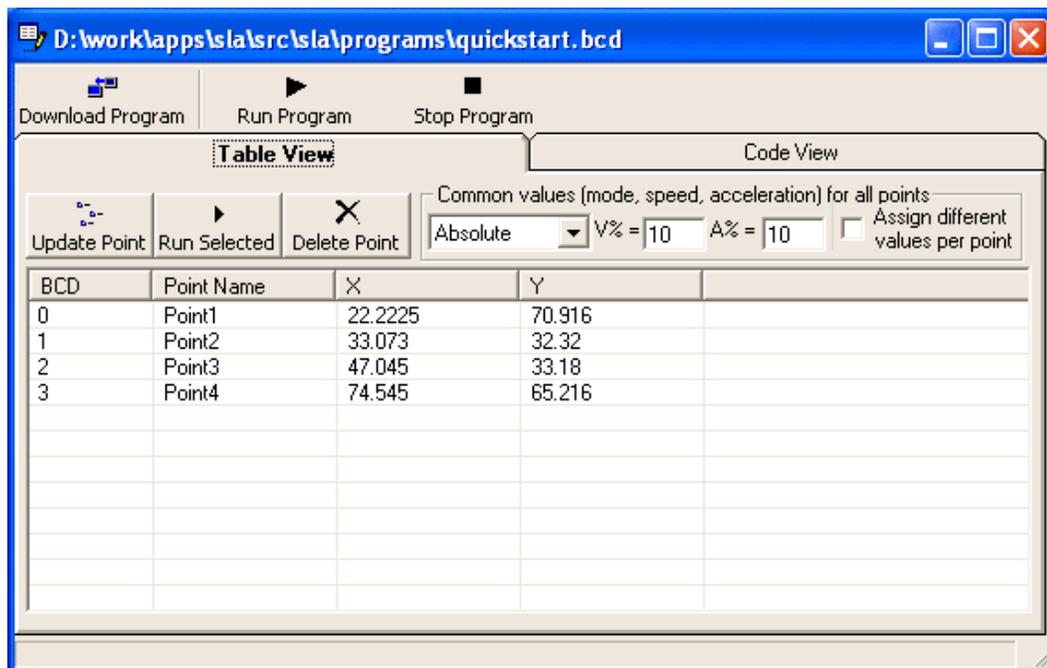

In the task selection window, you can select different ways to create a BCD program. Select the second option for creating a BCD program from existing data.

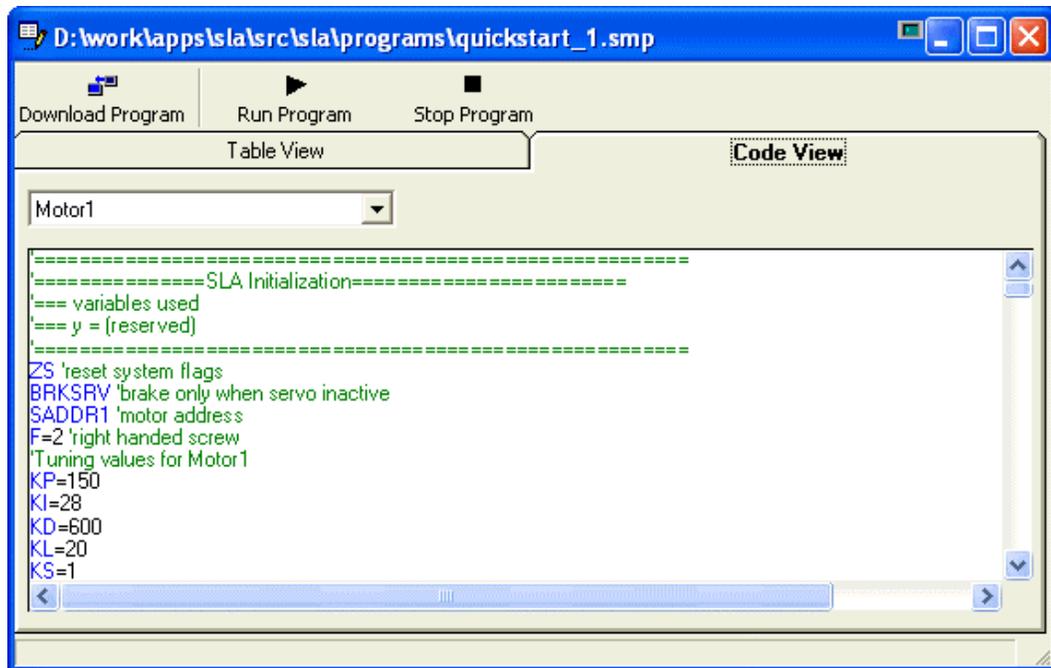

This will bring up a window with the position data tree that was earlier created in the Datasets window. Select the collection of points (either a path or points) to create BCD program from as shown below.

This will bring up the BCD Programming Environment showing the points and the corresponding BCD values.

Click on the 'Code View' tab to see the SLA OS generated code which also includes code for homing to match the existing configuration information. Note that the displayed code depends on the type of slide connected to the axis. The following display corresponds to SLA.

## Quick Results

Since all the code is already generated by the SLA OS software, there is no additional programming involved. Before you can run the program, compile and download the programs to all the motors by clicking on the 'Build and Download' button on the top. You should see the following confirmation to make sure that everything is successful.

Now, to run the program, click on the 'Run' button. This will result in the downloaded programs running in all the motors. By default, the generated programs run the homing routine initially. This behavior can be changed using the SMP Programming Environment since BCD programs are basically SLA OS generated SMP programs.

Once the programs are running, the motion can be achieved by feeding the correct input values using either a test BCD input box or PLC.

# Introduction

## Installing SLA OS Software

To install the software:

1. Close all programs including any copy of SLA OS Software.
2. If you have a previous copy of the software installed, uninstall it before installing the new version. (note: Older versions (before v1.2) require backing up of database located in "C:\Program Files\Robohand\SLA\data\data.mdb" in a safe location.) To uninstall the previous version, open Control Panel, click on 'Add or Remove Programs', click on 'SLA Operating Software' and follow the instructions for removing the software.
3. Double click on the installation setup.exe file. The installation wizard will lead through the steps for installation.
4. If you had to backup the database in earlier step, copy the database back in the original location.
5. Once the software is installed, it will create shortcuts on the Desktop as well as create additional menu items in the program menu accessible from standard Windows Start menu.

# Configuration

Once the software is installed, the next step is to configure it with the specific information about the system e.g. what kind of slides are attached, what are the stroke-lengths of each, the I/O information etc.

## Basic Configuration

Following demo shows the basic configuration of the software.

## I/O Configuration

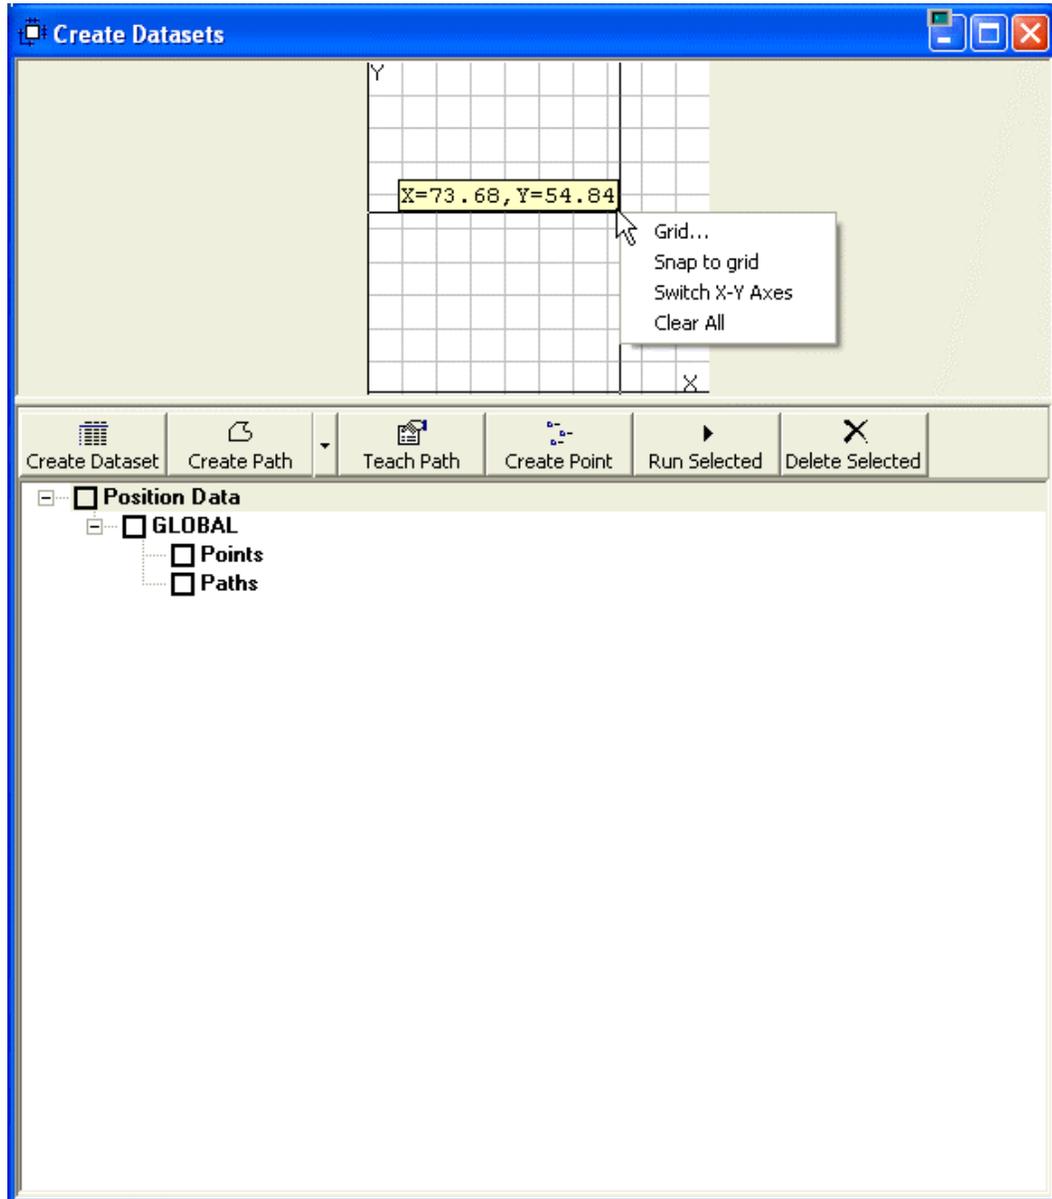

Following demo shows how to configure I/O onboard the motors as well as on the SLA External I/O Module.

## Manual Operations

The SLA OS comes with powerful manual operations capability that can be used to test the slides, test the created position and path data as well as interact with the slides directly through motor terminal. Following demo shows how to use Teach Pendant, how to do homing of the motors and how to run diagnostics to automatically fix problems with slides where possible. **Note that the slides must be homed before the valid position data can be taught.** This demo shows Teach pendant operations, homing motors and running diagnostics.

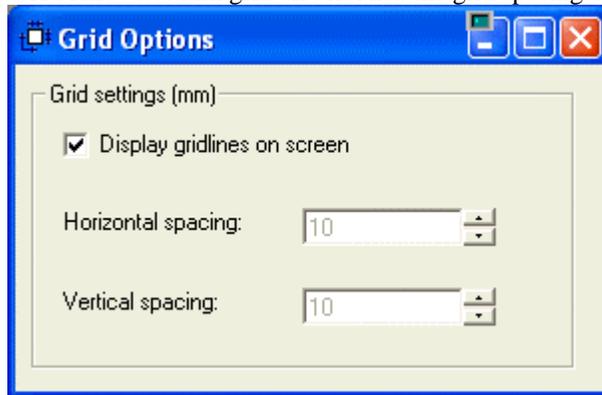

## Creating Position Data

Almost all programs require a well defined position data information. Using SLA OS's visual representation of XY plane, it is very convenient to create the data in XY plane. The main Dataset screen can be accessed by clicking on 'Datasets' icon on the toolbar.

The above picture shows the window after moving the mouse cursor on the graphical XY plane and right clicking on the region. Note the coordinates of a point are displayed while the cursor is on the region. The options available to configure the graphical area in the menu includes

1. **Grid** Allows to turn grid on/off. Also the grid spacing can be controlled from here.

2. **Snap to Grid** Once selected, the mouse pointer will snap to the grid intersections. This is very useful when positions to be created are known to be in the multiples of grid spacing.
3. **Switch X-Y Axes** Depending on the configuration of X-Y slides, the alternate orientation (Y axis horizontal and X axis vertical) can be useful in visualizing the points getting created.
4. **Clear All** This will clean the graphical screen of any drawings.

## Creating Position Data

This demo shows how to create position data using graphical area for both linear and curvilinear paths and independent positions.

There are two types of position data that can be created using the window.

1. **Points** These are independent collection of points, each of them defining a location in space. They can be created using 'Create Point' button on the toolbar.
2. **Paths** These are ordered collection of points defining a trajectory in space. There are two types of path, both of which can be defined using 'Create Path' dropdown combobox. By default, clicking on 'Create Path' will create Linear path.
  1. Linear - This is made up of connected straight lines.
  2. Arc - This defines a section of circle.

This position data can be contained in a dataset created using 'Create Dataset' button. It is highly recommended that each distinct project (where data is not shared) has its own dataset. This makes it easier to organize as well as access the data during programming. Once a dataset is created, the points or the paths contained within can be accessed following <datasetName>.<pointName> for a point and <datasetName>.<pathName> for a path e.g. MyDataset.path1 or MyDataset.point1. The system already comes with 'GLOBAL' dataset for sharing position data that could have cross project usage (e.g. origin). The data contained with 'GLOBAL' dataset can be accessed with or without prefixing the name 'GLOBAL' before it. e.g. GLOBAL.<pointName> or <pointName> both will work for the points contained in the 'GLOBAL' dataset.

## Creating Points

There are more than one way to create/update an independent point for a selected dataset. To create a point, select the 'Points' under the desired dataset. With the mouse, click on the desired point in the graphical area. Since the Z axis value is obtained from the current Z location, it might be beneficial to move to the desired Z location before creating points. Another way to create a point is to manually move the slides to the desired location and the clicking on 'Create Point' button on the toolbar. To make it easier to move slides by hand, be sure to turn off servo and disengage the automatic brake by clicking on 'Motor Servo' and 'Automatic Brake ON' buttons for the corresponding motors in the teach pendant tab on the main screen. This is very useful in creating points out of distinct locations in the work area. If any of the values require further

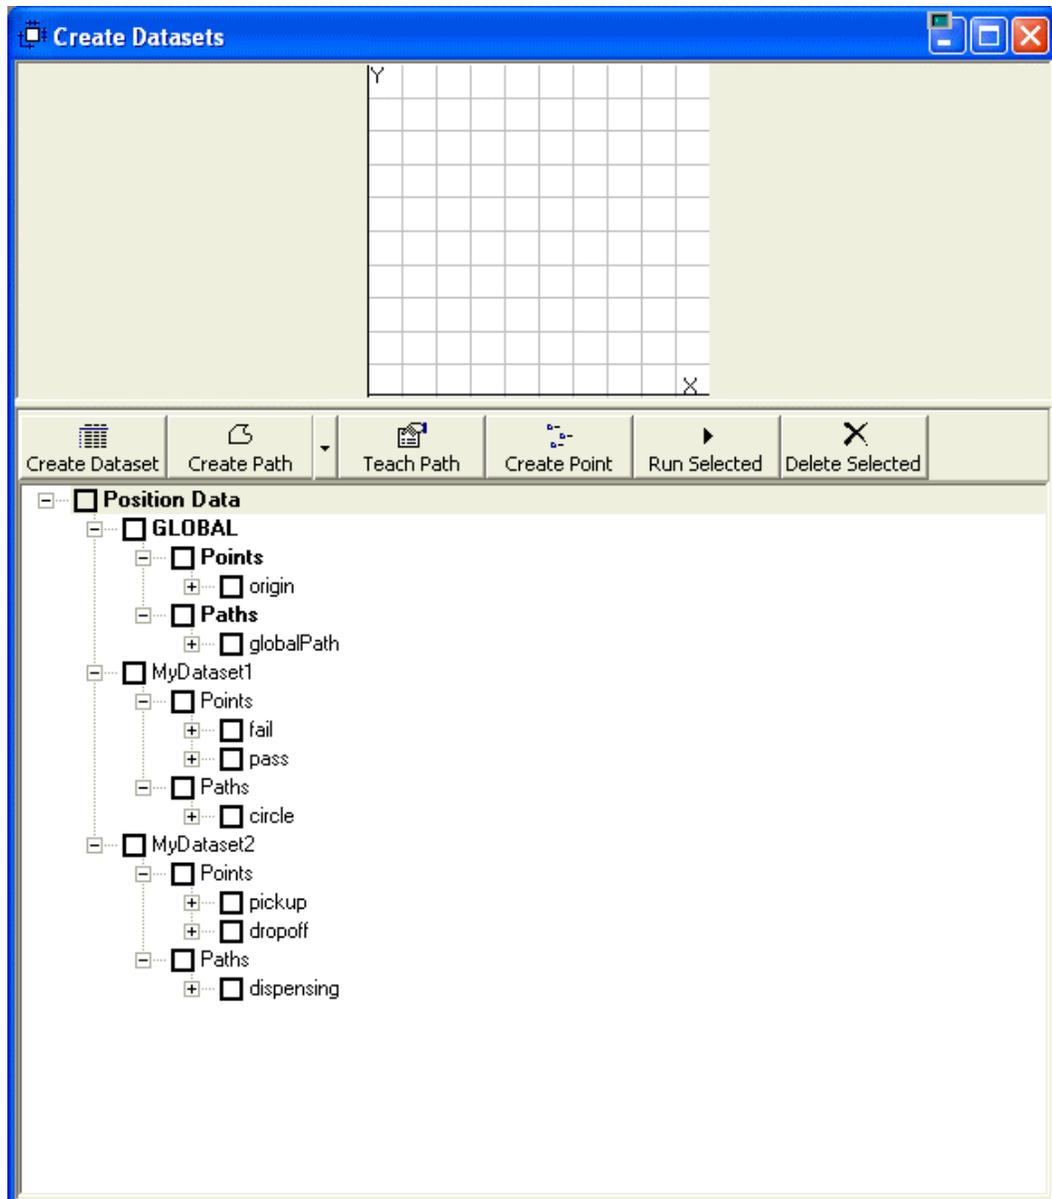

refinement, they can be edited by selecting and pressing the 'ESC' button or by clicking twice on the desired coordinate value.

**This demo shows how to create position data using current motor positions and updating an existing position with the current motor position.**

### Creating Paths

Paths can also be created in multiple way. Before any points can be added to a path, create the correct type of path (Linear or Arc) using the 'Create Path' button. For Linear paths, select the path and create sequence of points following the same sequence used for creating individual points. Notice that as more points are added, the path is drawn on the screen. For Arc paths, select each of the special points that get created and update them either through direct editing or clicking on 'Update Point' button or clicking with mouse in the graphical area.

Typical screen might look like below after creating position data for multiple projects. The checkboxes next to each of the node in the 'Position Data' tree can be used to draw the child nodes in the graphical area. e.g. By selecting the 'Position Data' checkbox, all the data contained in all datasets will be drawn on the screen. This is very useful in visualizing the various points location and path trajectories.

## Advanced ways to create paths

### Import Dataset

This demo shows how to create a path by importing AutoCAD generated DXF file to create a path. Other supported formats are XLS (Microsoft Excel file e.g. data.xls) and CSV (comma separated values, a plain text file e.g. data.txt). Note that in the XLS and CSV formats, the first row is discarded and must not contain the needed data.

### Teach Dataset

This demo shows how to create a path by turning the servo and brake off and manually moving the motors around to teach a path.

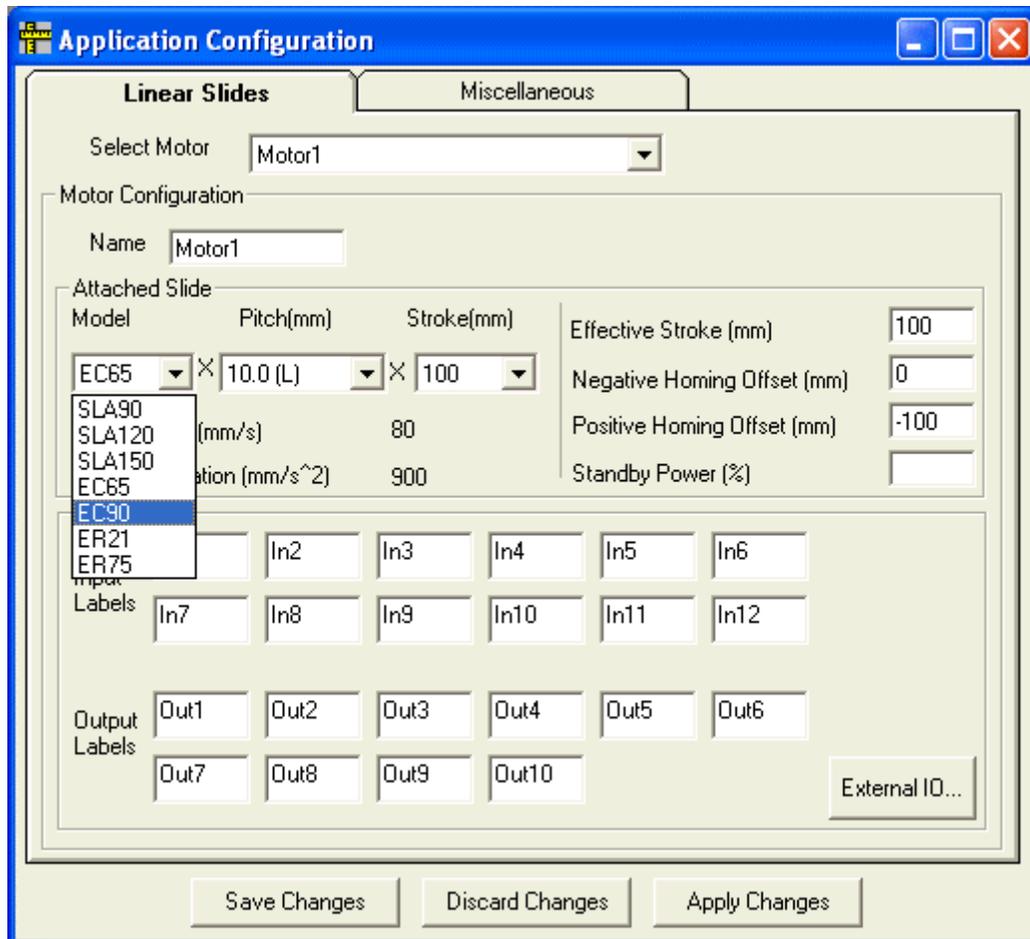

## Introduction to eCylinder/eRotary

eCylinder models (EC65 and EC90) are new additions to the growing electric product lines from DE-STA-CO Automation. It augments the existing SLA90, SLA120 and SLA150 products to provide flexible deployment options. Following are the major differences and notable similarities between the two types.

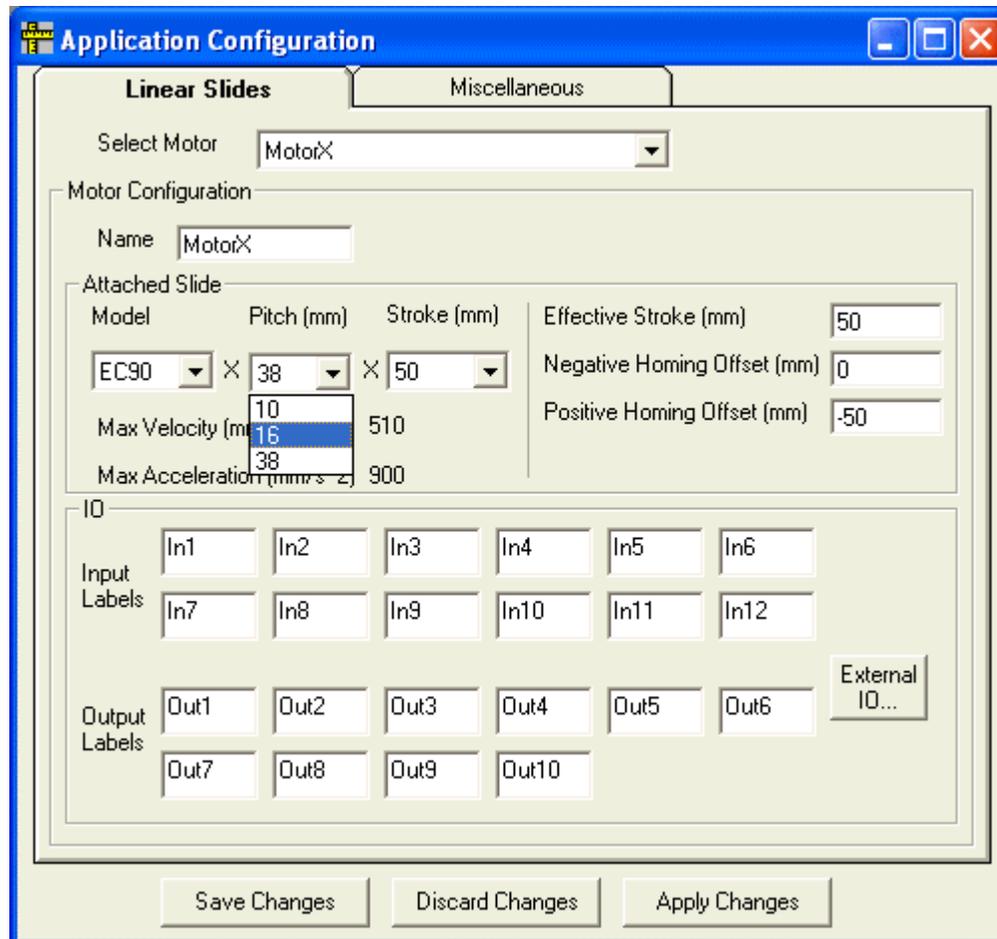

- eCylinder/eRotary are backward compatible with the Smart Motor Programming (SMP) command set which is used to drive the motors from the host computer.
- Currently only the BCD programs can be downloaded to the eCylinder/eRotary. Programming them for the BCD movements is same as that for SLA.
- eCylinder/eRotary can be operated using MMP programs. However, since they can't participate in a coordinated motion, the `sla.DoLine` and `sla.DoPath` commands are ignored by it. These motion commands can still be used to move SLA motors in a mixed deployment stage (e.g. X and Y are SLA slides, while Z is an eCylinder/eRotary). To move an eCylinder/eRotary from a MMP program, either of `sla.DoPositionMove`, `sla.DoRelativeMove` or `sla.DoVelocityMove` commands can be used.
- There are ten onboard outputs in eCylinder compare to six for SLA.
- eCylinder/eRotary have absolute encoders. However, to take into account the homing offsets, it is still necessary to carry out homing which adjusts the origin according to the offset values.

### Configuration Changes

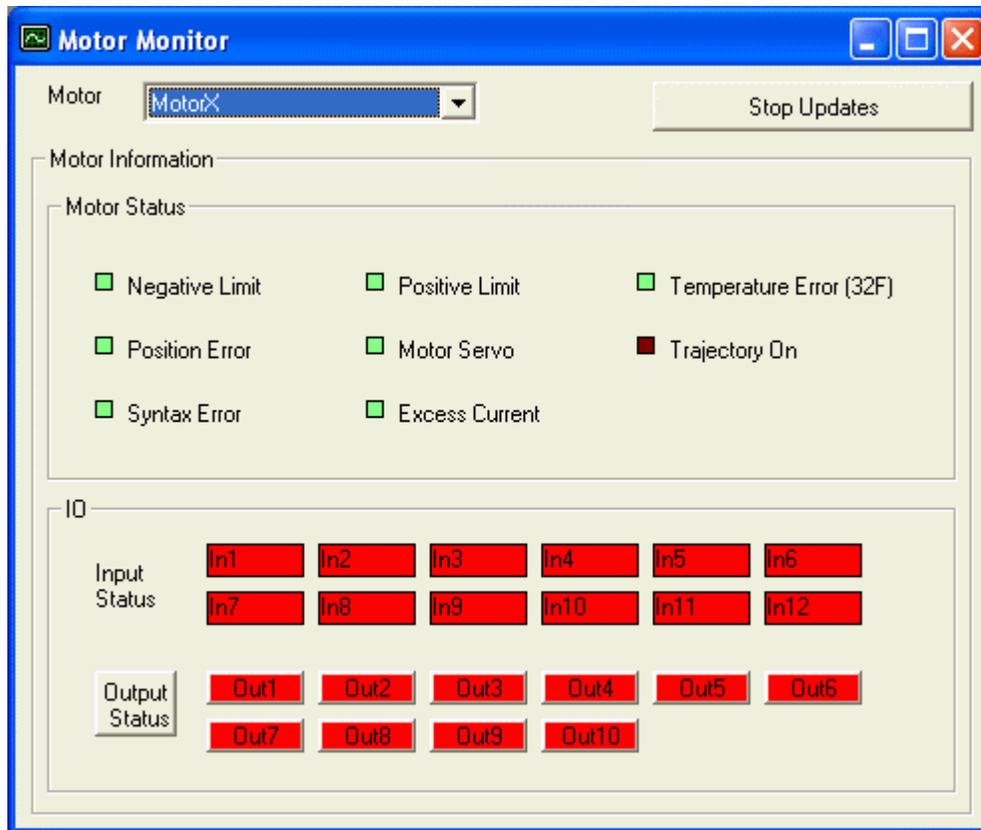

The main changes to the SLA OS program are in the configuration screen as shown below.

Two new eCylinder models (EC65 and EC90) and two new eRotary models (ER21 and ER75) are available for selection.

Each of the eCylinder model comes with multiple pitch selection. Also note the increased number of outputs to 10.

Motor monitor window shows correct number of IO states depending on the selected slide.

## eRotary Motion Specification

While SLA/eCylinder has been well understood in terms of what direction and by how much the movement would occur, eRotary (which has no negative/positive limits) needs clarity due to its circular nature. Following results are meant to assist in understanding the eRotary motion. All angles are specified in degrees.

Following is the result of various absolute positions starting from the current locatin at origin (RP = 0)

- P=360, motor will move 360 in clockwise direction. [RP returns 0]
- P=-360, motor will move 360 in anticlockwise direction. [RP returns 0]
- P=90, motor will move 90 in clockwise direction. [RP returns 90]
- P=-270, motor will move 270 in anticlockwise direction. [RP returns 90]
- P=450, motor will move 450 in clockwise direction. [RP returns 90]
- P=-450, motor will move 450 in anticlockwise direction. [RP returns 270]

Following is the result of various absolute positions starting from the current locatin at 90 (RP = 90)

- P=360, motor will move 270 in clockwise direction. [RP returns 0]
- P=-360, motor will move 450 in anticlockwise direction. [RP returns 0]
- P=90, motor will move 0 in clockwise direction. [RP returns 90]
- P=-270, motor will move 360 in anticlockwise direction. [RP returns 90]
- P=450, motor will move 360 in clockwise direction. [RP returns 90]

- P=-450, motor will move 540 in anticlockwise direction. [RP returns 270]

# Programming

## Creating Multi Motor Programs (MMP)

Multi Motor Programs (MMP) are the easiest and most flexible of all the programs available for SLA OS. Since these programs run on the PC Controller, they can create coordinated motions (by coordinating each of the slides), communicate with external IOs, interface with other USB/Ethernet devices and offer a very powerful development environment for creating and debugging programs in easy to use Basic language.

Following demo shows main steps for a simple MMP program.

To create a MMP program, open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). By default, the MMP program is selected. Type the name of the new program in 'Program Name' textbox and click 'Create Program' button. This will bring up the following window for developing MMP program with the template of the program already created as shown below.

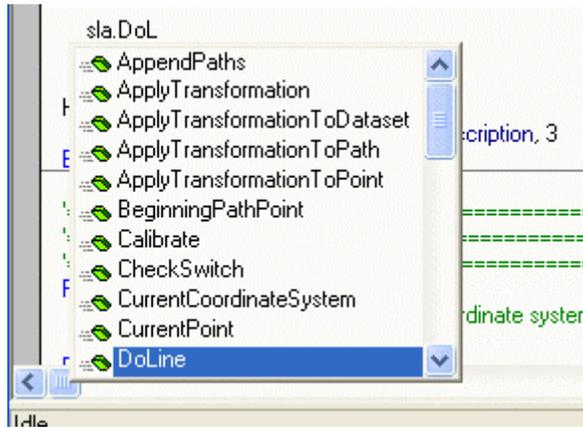

```
first (mmp) - Multi Motor Programming Environment [design]
File Edit View Macro Debug
[Icons]
Proc: [declarations]
'=====SLA Common Functions=====
'#USES "D:\work\apps\sla\src\sla\programs\slaFunctions.mmp"
'#USES "D:\work\apps\sla\src\sla\programs\userFunctions.mmp"
'=====SLA Multi Motor Program=====
Sub Main
On Error GoTo HandleError:
  init

  Exit Sub
HandleError:
  sla.LogMessage "Got error ->" & Err.Description, 3
End Sub
'=====Initialization Method=====
Private Sub init()
  sla.Reset 'initial reset of all motors & coordinate system
  sla.Calibrate(0) 'home all motors
End Sub
1
```

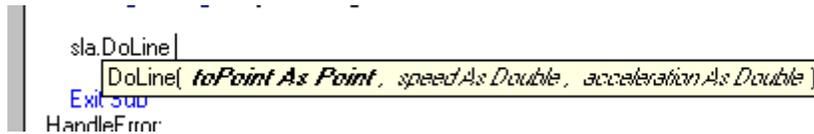

Type following text just after the init statement.

```
sla.LogMessage "My First Program"
```

Save the program by selecting 'Save' from the File menu or clicking the save icon in the toolbar. For running the program, click on the run icon or press 'F5'. (Caution: since by default the program will home the motors, make sure that there is no body near the slides or no obstacles are placed which can prevent homing. If desired, homing can be disabled by commenting out the 'sla.Calibrate(0)' statement in the init subroutine.). This should create a log entry in the 'Logs' tab of the main screen as well as writing in the logs.txt file located in the logs directory where the software is installed. All the commands that interface with the SLA OS start with 'sla.' prefix. As soon as 'sla.' is typed in the editor, the intellisense facility shows all the commands that available. The intellisense facility can also be activated by hitting 'CTRL-SPACE'.

Select the command that is appropriate for the use. The arguments to the command are also displayed as soon as a SPACE or '(' is typed.

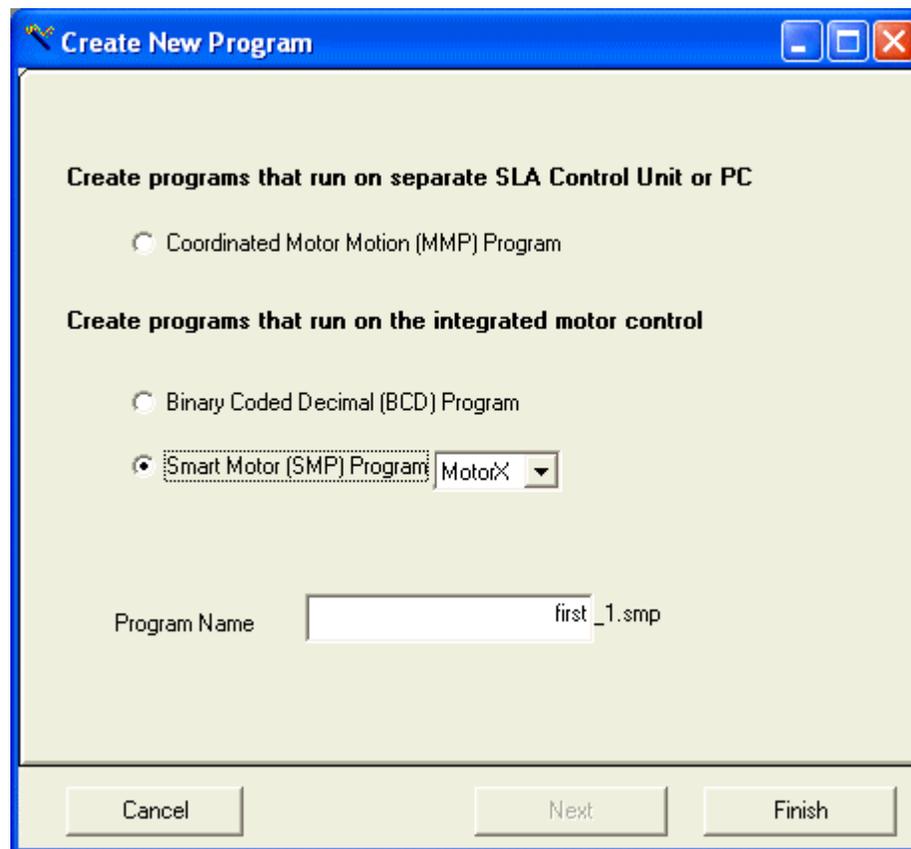

This makes it very convenient to write a MMP program.

## Creating Smart Motor Programs (SMP)

Smart Motor Programs (SMP) are normally created when there is no need for coordinated motion and the (optional) SLA Control Unit is not present. These programs can be created by using any supported Windows platform and uploaded directly into the motors. When the power is turned on, these programs run independently of each other in the individual motors. However, using shared IO signals some parts of these otherwise independent motion can be synchronized by waiting on the common signal. Since there is no real time coordination among the motors for a well defined trajectory, the resulting movement is sometimes referred as synchronized motion. The SMP programs are developed using its own development environment which allows for syntax coloring, syntax checking, compiling and easy uploading and downloading of the programs to a motor. These programs are written using simple Smart Motor Language.

Following demo shows main steps for a simple SMP program.

To create a SMP program, open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). Select the SMP program type and enter the name of the new program in 'Program Name' textbox. Note that by default, MotorX is selected. If you wish to write a SMP program for different motor, change the selection. Click 'Create Program' button.

This will bring up the following window for developing SMP program with the template of the program already created as shown below.

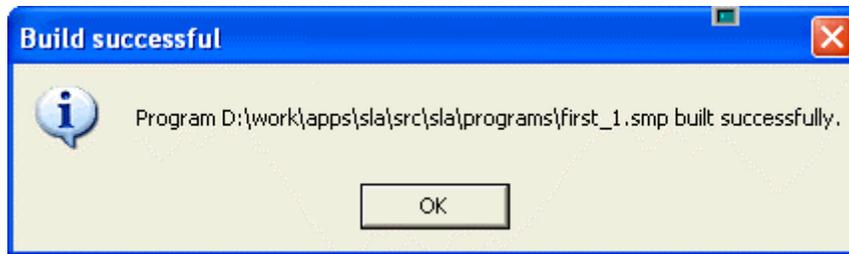

modifying the program in the editor. Enter the following program in the area indicated for user code.

```
MX
a = 1
WHILE a < 10
  a = a + 1
  D = 1000
  V = 100000
  A = 100
  G
  TWAIT
LOOP
```

To run the program, upload in the motor by clicking on 'Transfer Program from PC to Motor' on the toolbar and clicking the run button. This will result in ten short movements in the positive direction for MotorX.

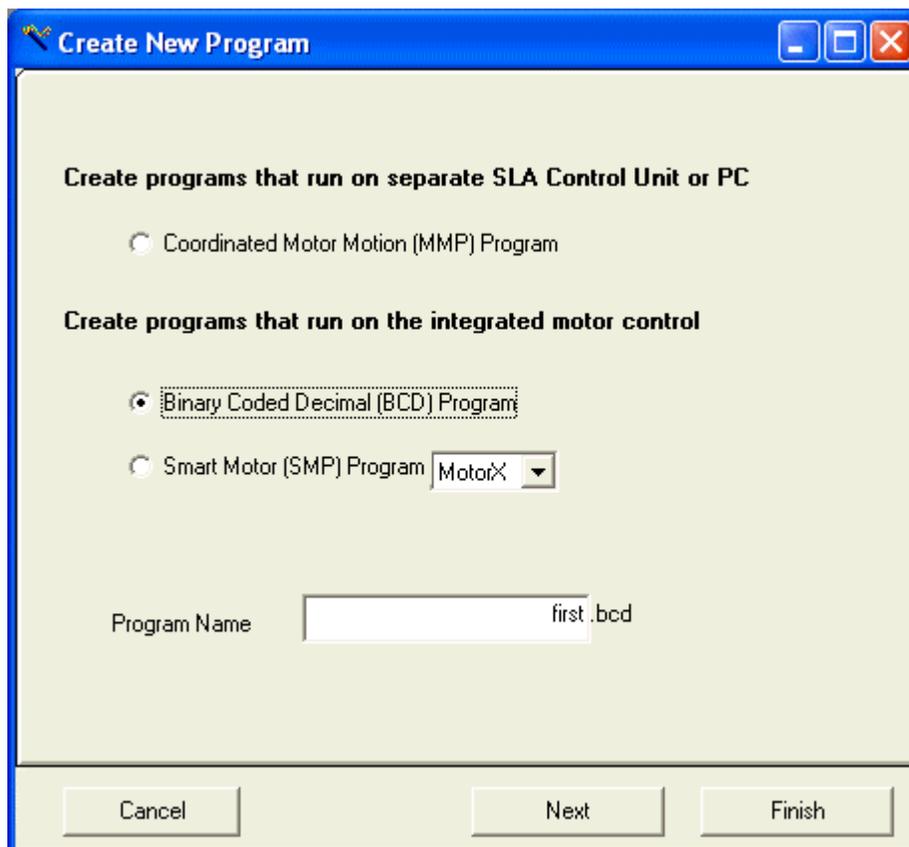

The SLA OS gives you complete control over the write, build and test process and you can iterate the process as many times as required to make sure that the program meets all your requirements. Once satisfied with the program, the PC is no longer required. When the power is turned ON again for the motor, the program will automatically start running from the beginning (by default homing).

## Creating Binary Coded Decimal Programs (BCD)

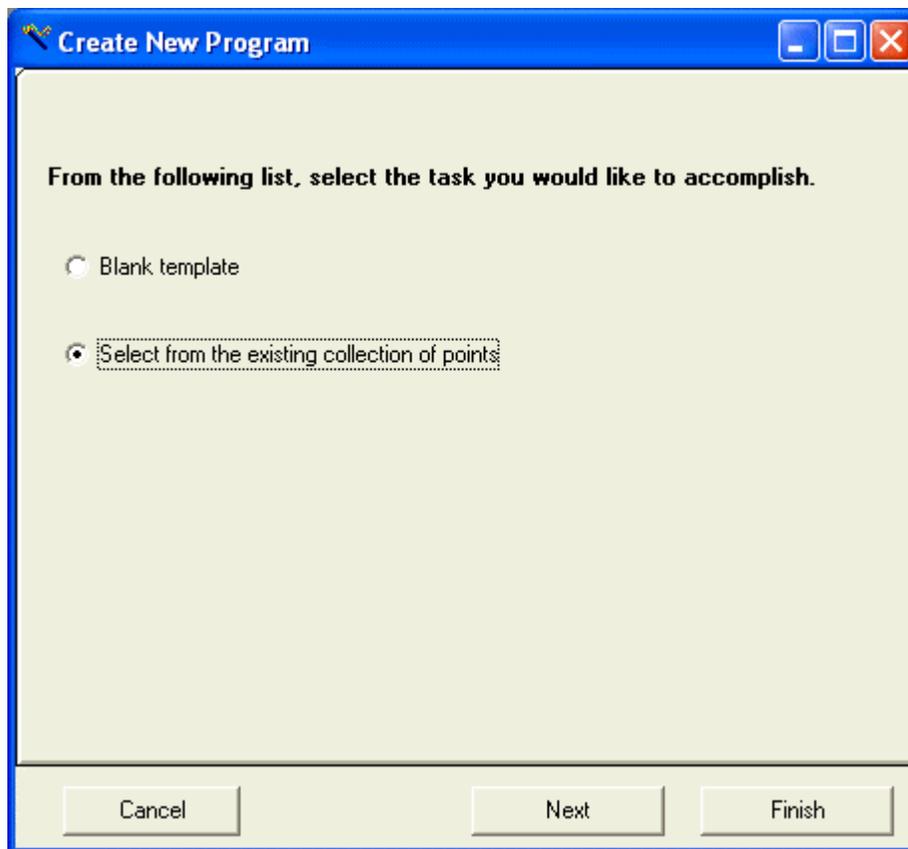

Binary Coded Decimal Programs (BCD) are nothing but simplified SMP programs. Since PLC based controls are very effective in coordinating various devices and generally used to move the slides to preprogrammed locations depending on the combination of BCD bits, this category of SMP programs have been separated out for special treatment. For BCD programs, all of the programming code is auto generated based on the selection of the locations. This includes tuning parameters download and homing subroutine. Since the generated code is a valid SMP program, it can be opened and edited in the much more flexible [SMP programming environment](#). This is sometimes necessary when more custom actions are required to achieve the goal.

**Following demo shows main steps for a simple BCD program.**

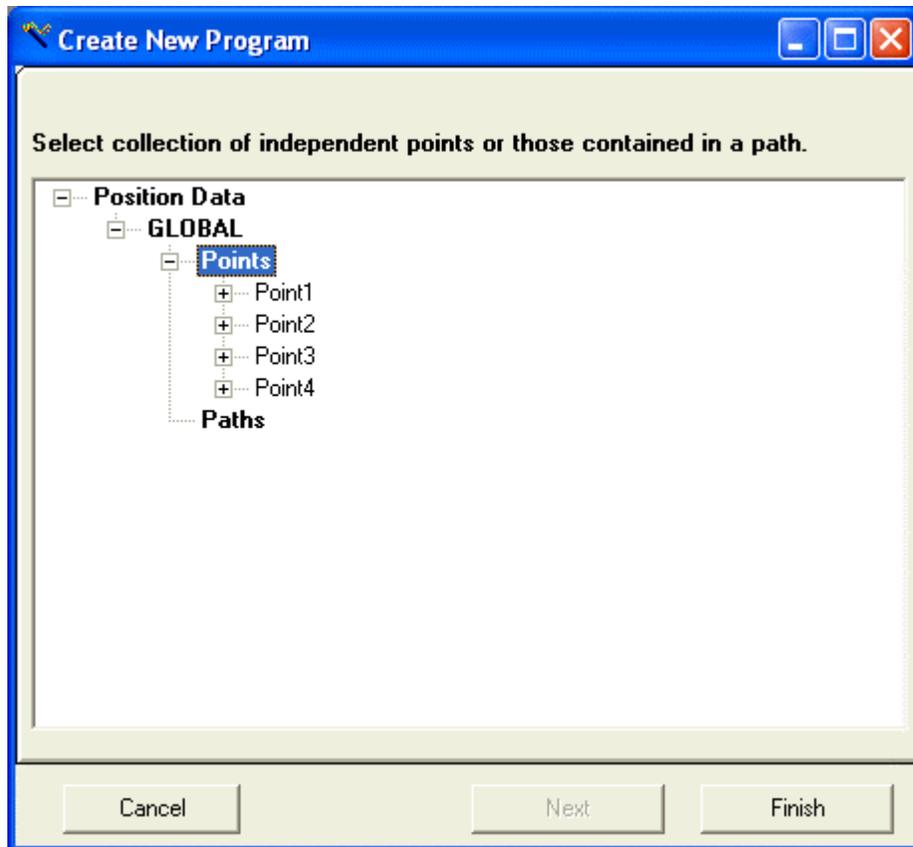

Before creating a BCD program, create few points as shown in the [BCD Quick Start](#) earlier. Now, to create a BCD program, open a 'New Program...' dialog by clicking on File menu or pressing Ctrl+N (Control and N together). Select the BCD program type and enter the name of the new program in 'Program Name' textbox. Click 'Next' button.

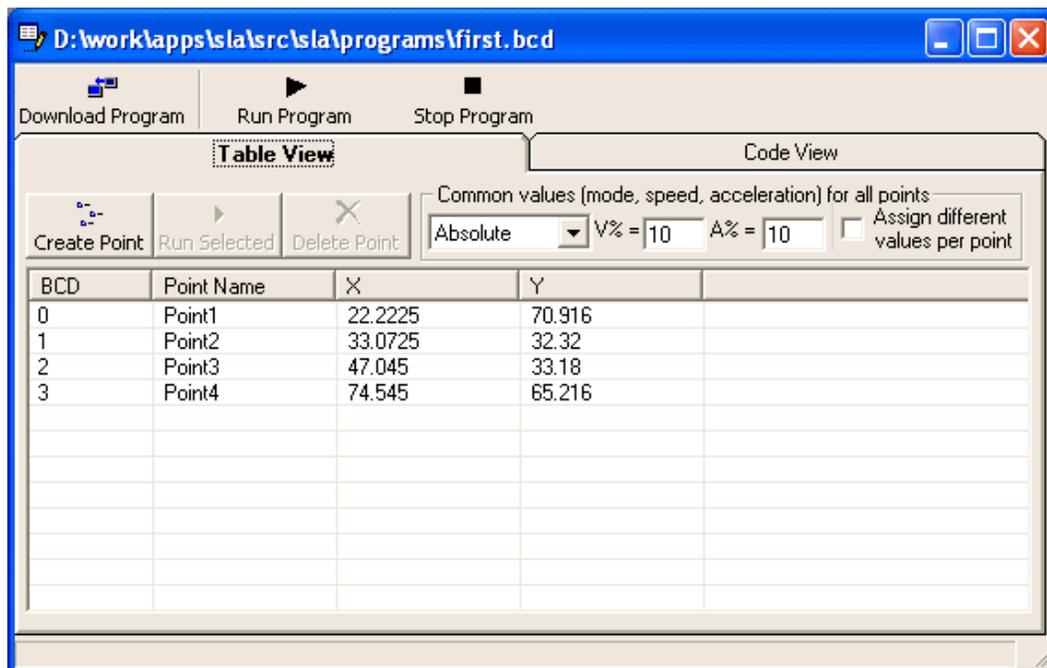

In the task selection window, you can select different ways to create a BCD program. Select the second option for creating a BCD program from existing data.

This will bring up a window with the position data tree that was earlier created in the Datasets window. Select the collection of points (either a path or points) to create BCD program from as shown below.

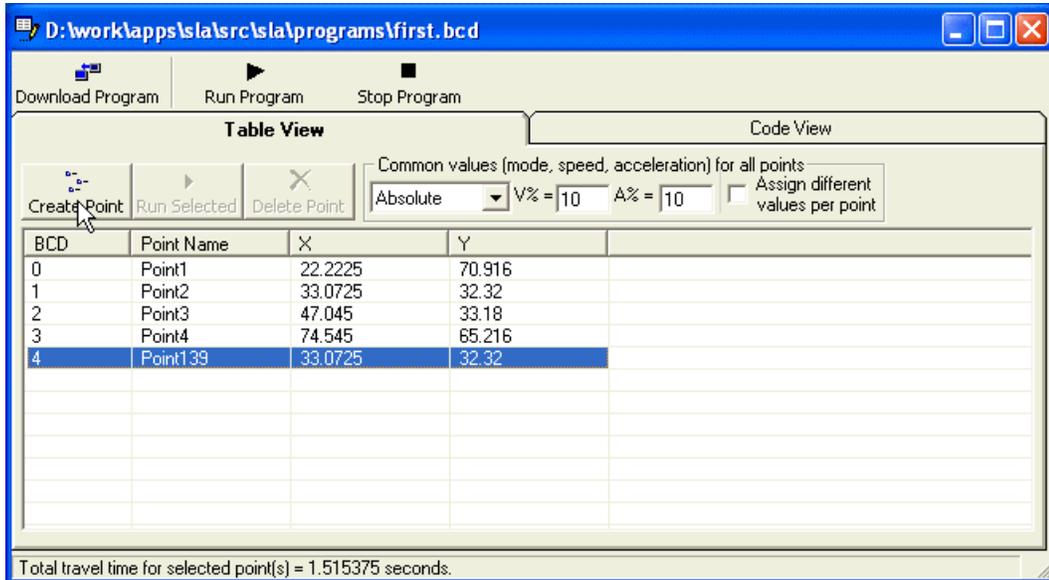

This opens the BCD Programming Environment showing the points and the corresponding BCD values.

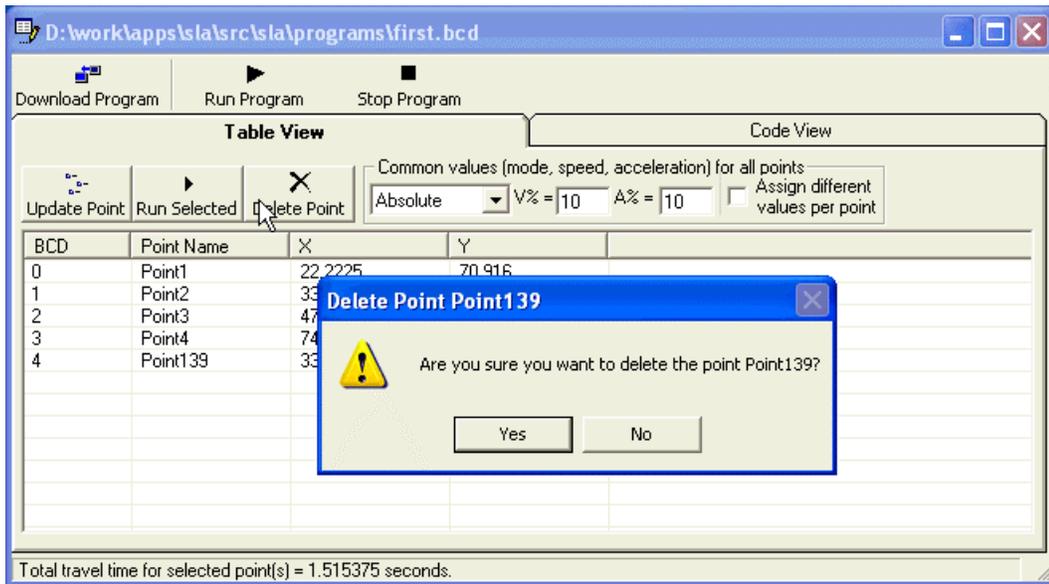

Note the automatically assigned BCD values (starting from 0) depending on the order of the points in the selected collection of points. While this is the default behavior, it can be modified by using the SMP programming environment. The BCD programming environment has evolved into a

powerful IDE to create PLC driven onboard programs without writing single line of code. From this screen you can take following actions which modifies the actual generated code.

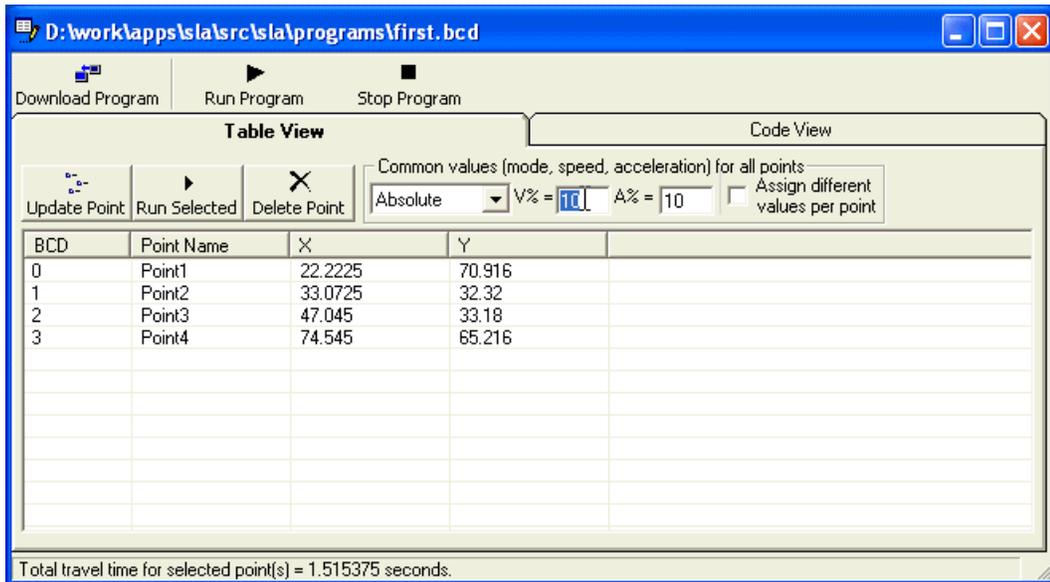

- Create an additional point in the BCD sequence.

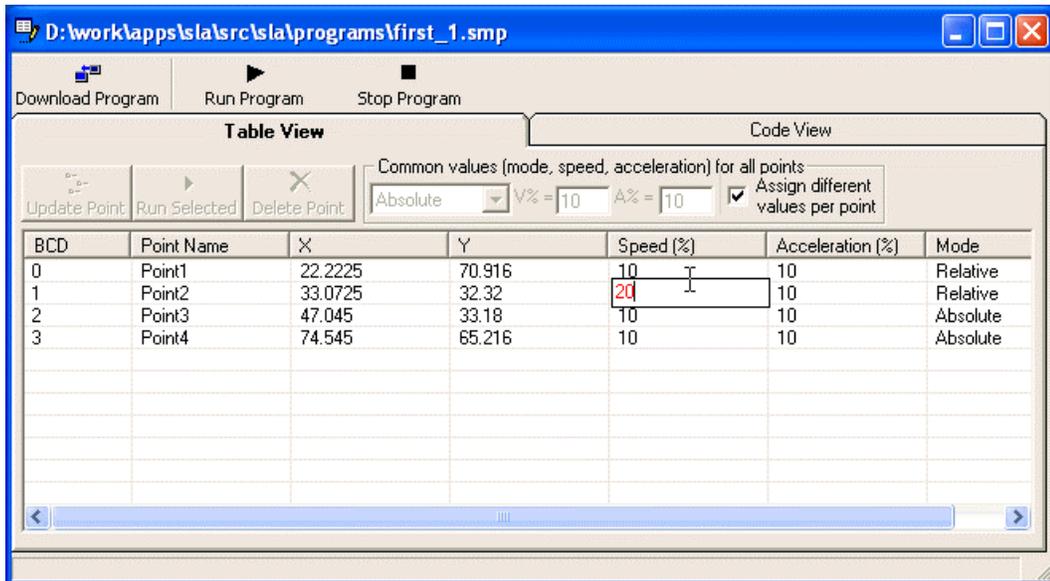

- Delete an existing point the BCD sequence.

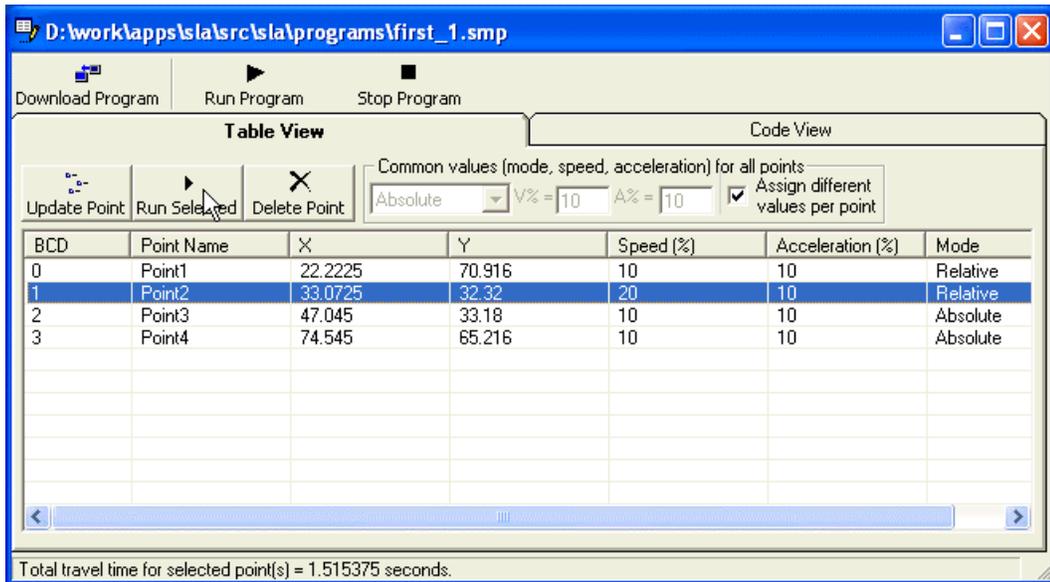

- Adjust speed, acceleration and mode (whether absolute or relative) for all points during motion

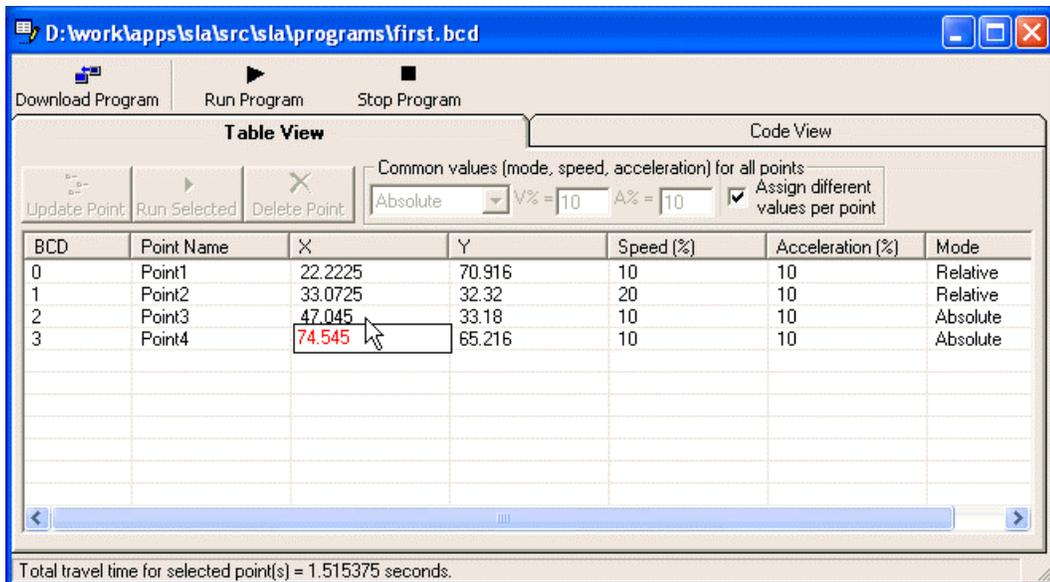

- Adjust speed, acceleration and mode (whether absolute or relative) for each individual point separately during motion

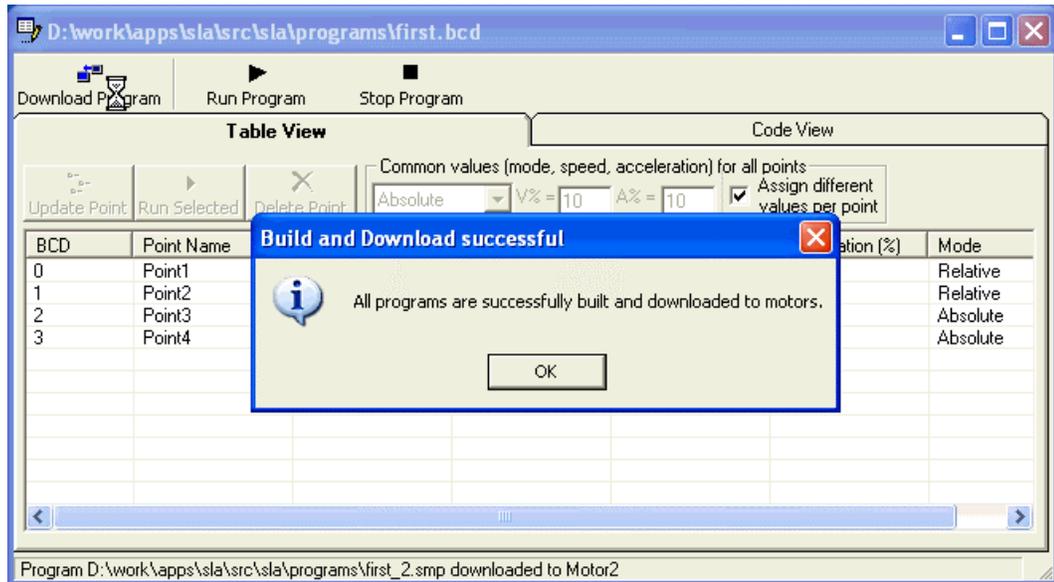

- Test any of the point by selecting and clicking on 'Run Selected' button

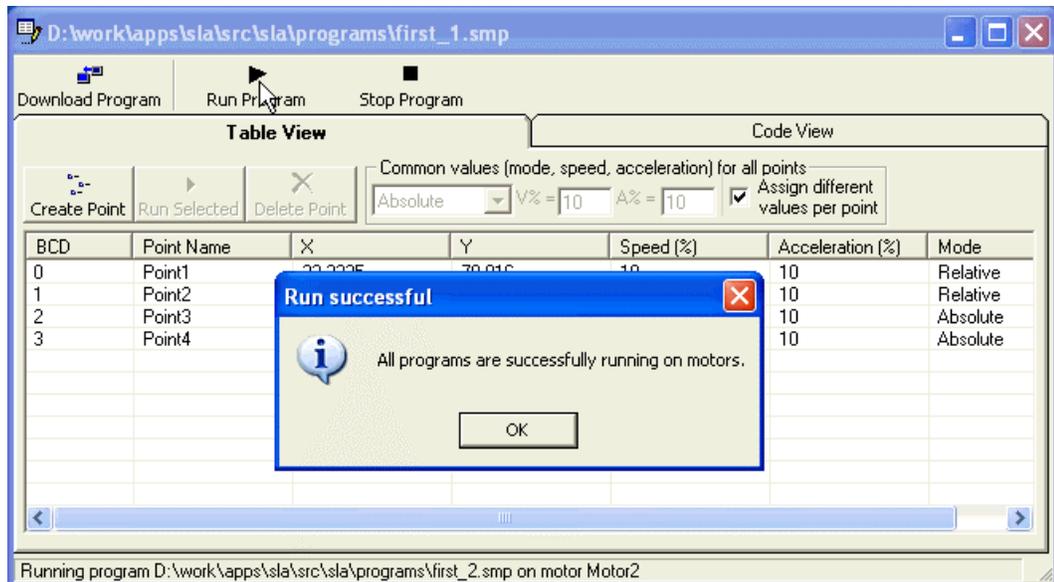

- Edit name, position values, speed, acceleration or mode directly in the table

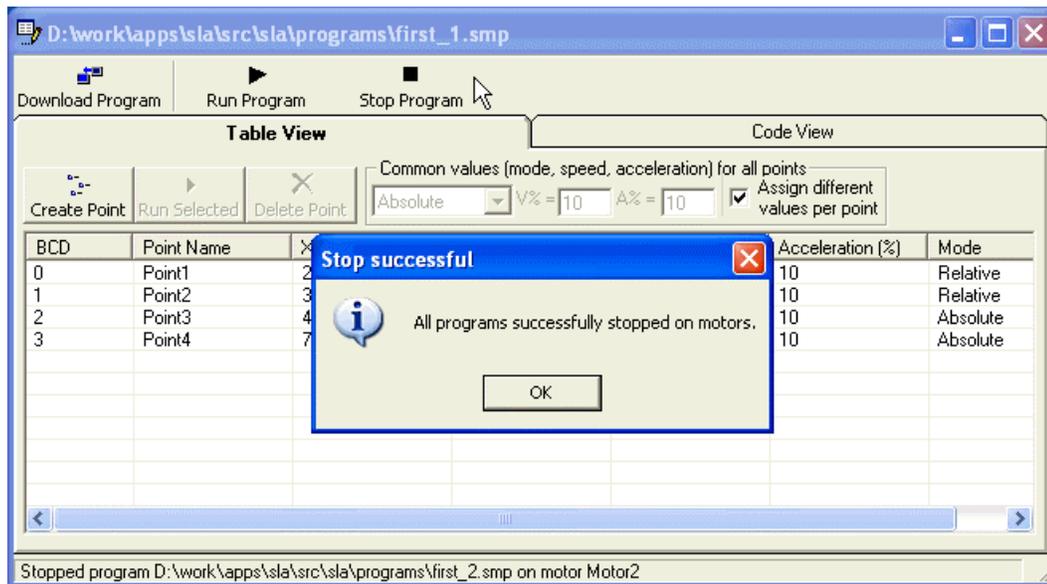

- Download generated programs to all motors with single click

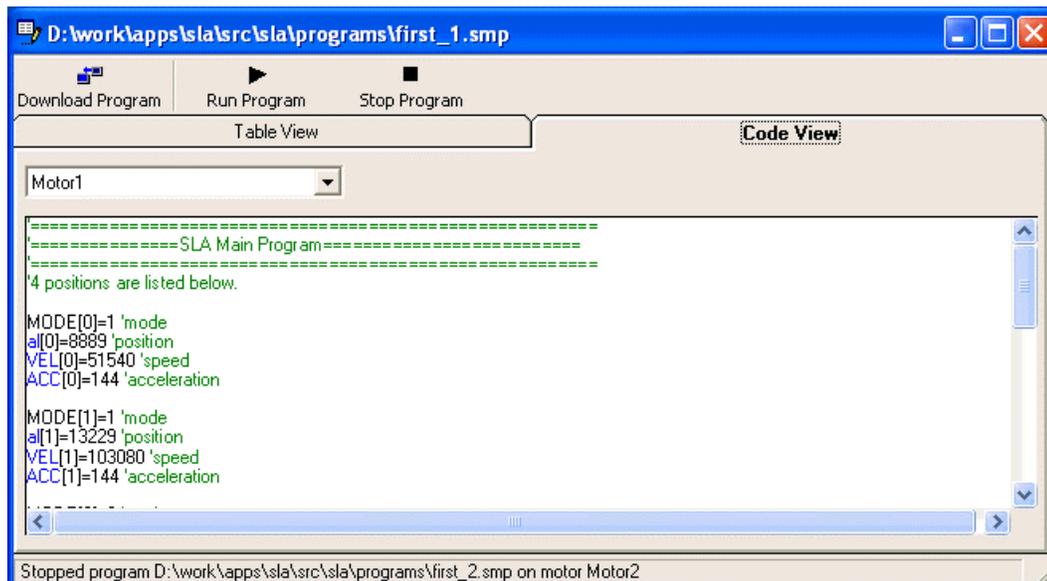

- Run all programs on all motors with single click

- Stop all programs on all motors with single click

While all the above actions are possible in the table view, code is transparently kept in synch with the table view. To view the code, you can switch to the 'Code View' as shown below. Note that the name of the corresponding generated SMP file is displayed on the title bar. Since one BCD program corresponds to as many SMP programs as the number of motors present, you can view each of those programs by selecting the appropriate motor from the dropdown box. Another thing to note is that the code displayed is not editable and the only way to modify the default generated behavior is using an SMP editor. Note that the code depends on the type of slide connected to the axis. The following display corresponds to an eCylinder.

To run the program, simply build and download the generated programs to all the motors by clicking on the 'Download Program' button in the toolbar. Once all the programs have been downloaded, click the run button to run all programs.

# External Systems

SLA OS can connect to the external vision systems to access the image analysis data. This data can be used in a MMP program to drive the SLA system.

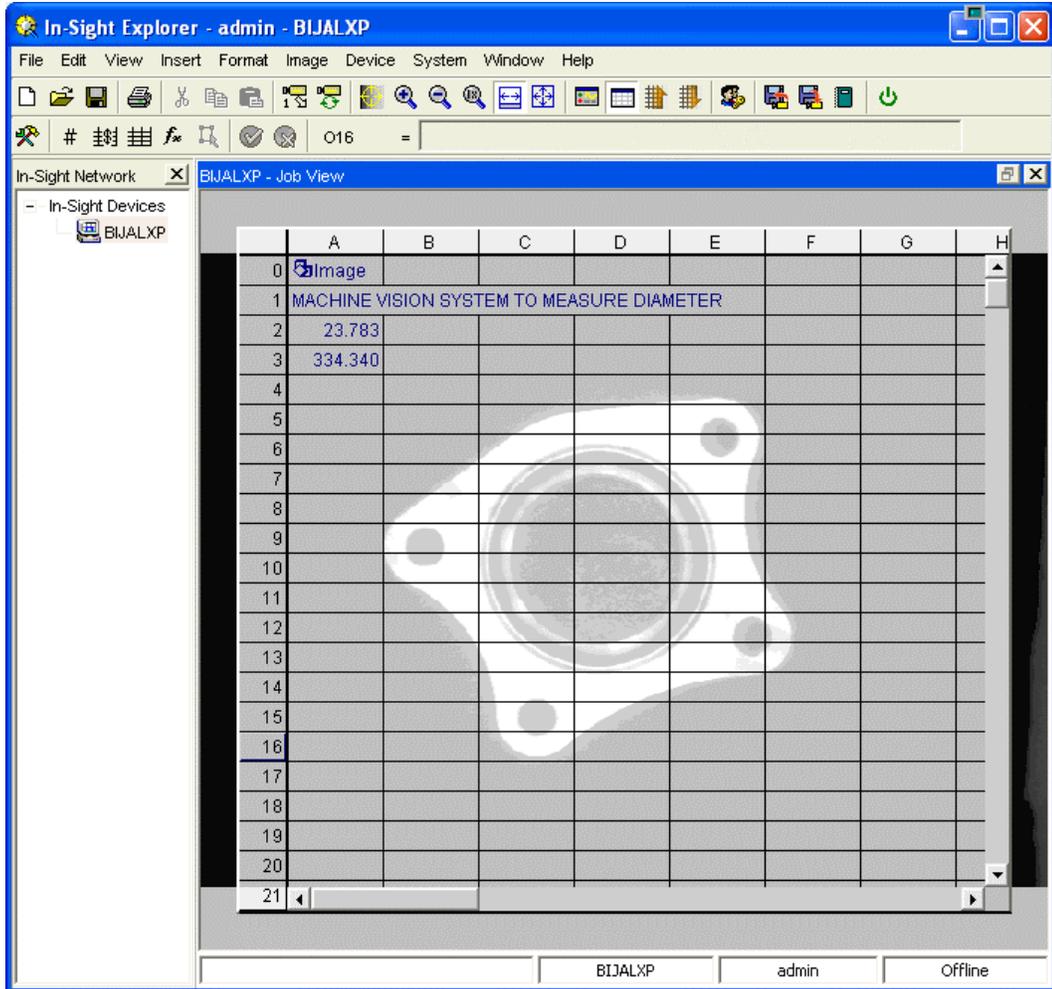

Following Vision systems are supported in the SLA software.

- [Cognex Machine Vision](#)
- [DVT Machine Vision](#) (coming soon)

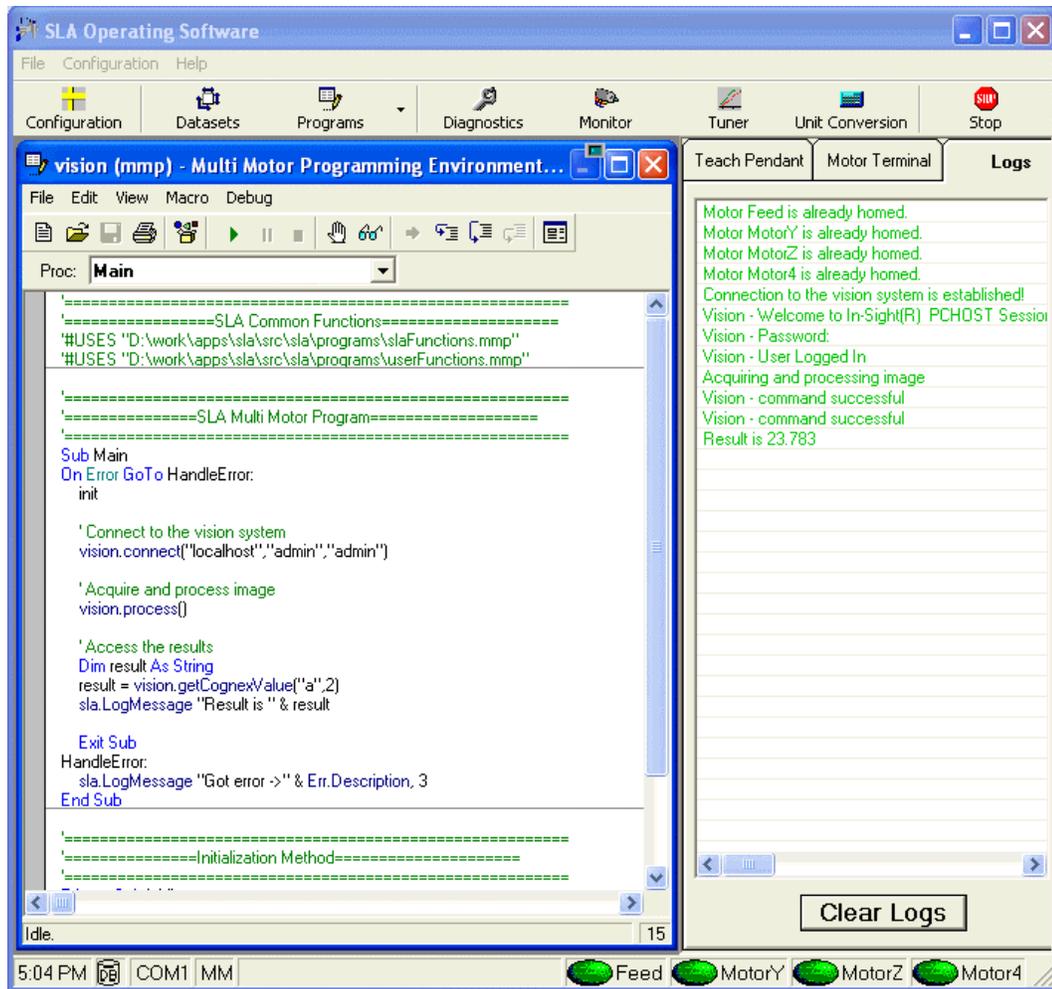

Using SLA OS's vision interface, it is trivial to connect to the supported vision systems. The three main steps involved are:

1. **Connect** - First step is to connect to the vision system. The underlying software takes care of all the native connection details.
2. **Process** - Once connected to the vision system, the image acquisition and processing by the vision system can be triggered programmatically, for example, depending on the selected input signal.
3. **Access** - The results of the processing of the machine vision image by the camera can be accessed using simple access command.

Following image shows a Cognex device after acquiring the image and processing to show the result value of 23.783 in A2 cell.

Following simple program shows the three steps mentioned earlier to access the result value. The log shows the successful reading of the value.

Once the value is read, subsequent steps in the program can depend on the analysis of the results.

For complete descriptions of the vision commands, please refer to the [Vision Commands Reference](#).

# Examples

## Sample programs

Following is a list of programs that are packaged with the SLA OS software and can be found in the *samples* folder under the main installation location (usually C:\Program Files\Robohand\SLA). Most of these programs also have the corresponding database files which contains the data about points and paths used in the programs. To run a program

1. Copy the program file in the *programs* folder under the main installation location.
2. Copy the corresponding database file in the *data* folder under the main installation location.
3. Start the SLA OS program and select the correct database from the dropdown list of databases.
4. Select the corresponding program from the File/Open menu.
5. If it is SMP or BCD program, build, download and run the program. MMP program can be run from the host controller itself.

---

### MMP programs

- **MMP-Prog1-HOMING** [source]  
This is a basic example of homing triggered by an user input.
- **MMP-Prog2-MessageWindow** [source]  
This program demonstrates blocking message window with acknowledgement.
- **MMP-Prog3-MovingPointToPoint** [source]  
This program demonstrates simple point to point coordinated motion.
- **MMP-Prog4-LinearPath** [source]  
This program demonstrates basic linear path coordinated motion with various parameters.
- **MMP-Prog5-CurvilinearPath** [source]  
This program demonstrates basic curvilinear path coordinated motion with various parameters.
- **MMP-Prog6-AppendedPath** [source]  
This program combines various paths into a single path for creating complex composite path.
- **MMP-Prog7-ControllingIOs** [source]  
This program demonstrates various commands for controlling IOs.
- **MMP-Prog8-CreatingNewPoint** [source]  
This program creates a new point dynamically based on user inputs.
- **MMP-AdvancedProg1-ControllingTorque** [source]  
This is an advance example for reducing maximum current output to the motor which in turn limits the maximum torque output by the motor.
- **MMP-AdvancedProg2-Autostart** [source1, source2]  
This is an example of multi tasking feature with one program monitoring the health of the system and launching the main application program when system is ready.
- **MMP-AdvancedProg3-OffsetPattern** [source]  
This is an example of utilizing advanced transformation commands to offset a path along various axes.
- **MMP-AdvancedProg4-RotatePattern** [source]  
This is an example of utilizing advanced transformation commands to rotate a path along an axis at various angles.

## **SMP programs**

- **SMP-Prog1-HOMING** [source1, source2]  
This SMP program shows how to control IOs and wait for user input before proceeding with homing.
- **SMP-Prog2-JOGGING** [source]  
This program shows how to create Teach Pendant like functionality using a toggle switch and a push button.
- **SMP-Prog3-PICK-N-PLACE** [source1, source2]  
The two independent SMP programs use common IOs to synchronize their movements.

# Reference

## MMP Commands Reference

Following are the MMP Commands which can be used in a Multi Motor Program (MMP) along with [SLA](#) and [HMI](#) Commands. They are arranged in [related groups](#) and in [alphabetic order](#) for easy access.

---

### MMP Commands in Related Groups

The MMP Commands are categorized in each group depending on their functionalities.

- **MMP Declaration Commands**

These commands are used to declare the variables, functions and subroutines in a program.

- [Const Definition](#)
- [Dim Definition](#)
- [Function Definition](#)
- [Main Sub](#)
- [Option Definition](#)
- [ReDim Instruction](#)
- [Sub Definition](#)

- **MMP Assignment Commands**

These commands are used to assign values or objects to the variables.

- [Set Instruction](#)

- **MMP Flow Control Commands**

Using flow control commands, the path of execution through a program can be controlled by checking for values of variables or IO switches. They are also used to perform iterations using loop constructs.

- [Do Statement](#)
- [End Instruction](#)
- [Exit Instruction](#)
- [For Statement](#)
- [For Each Statement](#)
- [Goto Instruction](#)
- [If Statement](#)
- [Select Case Statement](#)
- [While Statement](#)

- **MMP Error Handling Commands**

For a robust program, error handling can be achieved by using the On Error command.

- [Err Object](#)
- [On Error Instruction](#)

- **MMP Conversion Commands**

These commands can be used to convert one datatype to another.

- [Array Function](#)
- [CStr Function](#)

- **MMP Variable Info Commands**

These commands give additional information about variables.

- [LBound Function](#)
- [UBound Function](#)

- **MMP Math Commands**

These commands can be used for mathematical calculations.

- [Abs Function](#)

- **MMP String Commands**

These commands relate to the text string handling capability of a program.

- [Str\\$ Function](#)

- **MMP User Input Commands**

Using these commands, a dialog box can be generated to display or obtain information.

- [InputBox\\$ Function](#)

- 
- [MsgBox Instruction/Function](#)

- **MMP Miscellaneous Commands**

These are miscellaneous commands useful for programming.

- [DoEvents Instruction](#)
- [Wait Instruction](#)

- **MMP Operator Commands**

These are commands related to operation between variables.

- [Operators](#)
- 

## MMP Commands in Alphabetic Order

1. [Abs Function](#)
2. [Array Function](#)
3. [Const Definition](#)
4. [CStr Function](#)
5. [Dim Definition](#)
6. [Do Statement](#)
7. [DoEvents Instruction](#)
8. [End Instruction](#)
9. [Err Object](#)
10. [Exit Instruction](#)
11. [For Statement](#)
12. [For Each Statement](#)
13. [Function Definition](#)
14. [Goto Instruction](#)
15. [If Statement](#)
16. [InputBox\\$ Function](#)
17. [LBound Function](#)
18. [Main Sub](#)
19. [MsgBox Instruction/Function](#)
20. [On Error Instruction](#)
21. [Operators](#)
22. [Option Definition](#)
23. [ReDim Instruction](#)
24. [Select Case Statement](#)
25. [Set Instruction](#)
26. [Str\\$ Function](#)
27. [Sub Definition](#)
28. [UBound Function](#)

- 29. [Wait Instruction](#)
  - 30. [While Statement](#)
- 

## MMP Commands

### 1. Abs Function

**Summary** Return the absolute value. Parameter Description Num Return the absolute value of this numeric value. If this value is Null then Null is returned.

**Declaration** Abs(Num)

**Example**

```
Sub Main
    Debug.Print Abs(9) ' 9
    Debug.Print Abs(0) ' 0
    Debug.Print Abs(-9) ' 9
End Sub
```

Group [MMP Math Commands](#)

### 2. Array Function

**Summary** Return a variant value array containing the exprs.

**Declaration** Array([expr[, ...]])

**Example**

```
Sub Main
    X = Array(0,1,4,9)
    Debug.Print X(2) ' 4
End Sub
```

Group [MMP Conversion Commands](#)

### 3. Const Definition

**Summary** Define name as the value of expr. The expr may refer other constants or built-in functions. If the type of the constants is not specified, the type of expr is used. Constants defined outside a Sub, Function or Property block are available in the entire macro/module. Private is assumed if neither Private or Public is specified.

**Declaration** [ | Private | Public ] \_ Const name[type] [As Type] = expr[, ...]

#### Example

```
Sub Main
    Const Pi = 4*Atn(1), e = Exp(1)
    Debug.Print Pi ' 3.14159265358979
    Debug.Print e ' 2.71828182845905
End Sub
```

Group [MMP Declaration Commands](#)

### 4. CStr Function

**Summary** Convert to a string. Parameter Description Num|\$ Convert a number or string value to a string value.

**Declaration** CStr(Num|\$)

#### Example

```
Sub Main
    Debug.Print CStr(Sqr(2)) '"1.4142135623731"'
End Sub
```

Date Data Typef

Group: Data Type

Description:

A 64 bit real value. The whole part represents the date, while the fractional part is the time of day. (December 30, 1899 = 0.) Use #date# as a literal date value in an expression.

Group [MMP Conversion Commands](#)

## 5. Dim Definition

**Summary** Dimension var array(s) using the dims to establish the minimum and maximum index value for each dimension. If the dims are omitted then a scalar (single value) variable is defined. A dynamic array is declared using ( ) without any dims. It must be ReDimensioned before it can be used.

**Declaration** Dim [ WithEvents ] name [ type ] [ ( [ dim [ , ... ] ] ) ] [ As [ New ] type ] [ , ... ]

### Example

```
Sub DoIt(Size)
Dim C0,C1(),C2(2,3)
ReDim C1(Size) ' dynamic array
C0 = 1
C1(0) = 2
C2(0,0) = 3
Debug.Print C0;C1(0);C2(0,0) ' 1 2 3
End Sub

Sub Main
DoIt 1
End Sub
```

Group [MMP Declaration Commands](#)

## 6. Do Statement

### Summary

**Declaration** Do statements Loop -or- Do { Until|While } condexpr statements Loop -or- Do statements Loop { Until|While } condexpr

### Example

```
Sub Main
    I = 2
    Do
        I = I*2
    
```

```
Loop Until I > 10
Debug.Print I ' 16
End Sub
```

**Group** [MMP Flow Control Form 1: Do statements forever. The loop can be exited by using Exit or Goto. Commands](#)

## 7. DoEvents Instruction

**Summary** This instruction allows other applications to process events.

**Declaration** DoEvents

**Example**

```
Sub Main
    DoEvents ' let other apps work
End Sub
```

Double Data Type

Group: Data Type

Description:

A 64 bit real value.

**Group** [MMP Miscellaneous Commands](#)

## 8. End Instruction

**Summary** The end instruction causes the macro to terminate immediately. If the macro was run by another macro using the MacroRun instruction then that macro continues on the instruction following the MacroRun.

**Declaration** End

**Example**

```
Sub DoSub
    L$ = UCase$(InputBox$("Enter End:"))
    If L$ = "END" Then End
    Debug.Print "End was not entered."
```

```
End Sub
```

```
Sub Main
```

```
    Debug.Print "Before DoSub"
```

```
    DoSub
```

```
    Debug.Print "After DoSub"
```

```
End Sub
```

Group [MMP Flow Control Commands](#)

## 9. Err Object

**Summary** Set Err to zero to clear the last error event. Err in an expression returns the last error code. Add vbObjectError to your error number in ActiveX Automation objects. Use Err.Raise or Error to trigger an error event. Err[.Number] This is the error code for the last error event. Set it to zero (or use Err.Clear) to clear the last error condition. Use Error or Err.Raise to trigger an error event. This is the default property. Err.Description This string is the description of the last error event. Err.Source This string is the error source file name of the last error event. Err.HelpFile This string is the help file name of the last error event. Err.HelpContext This number is the help context id of the last error event. Err.Clear Clear the last error event.

**Declaration** Err

**Example**

```
Sub Main
```

```
    On Error GoTo Problem
```

```
    Err = 1 ' set to error #1 (handler not triggered)
```

```
    Exit Sub
```

```
Problem: ' error handler
```

```
Error Err ' halt macro with message
```

```
End Sub
```

Group [MMP Error Handling Commands](#)

## 10. Exit Instruction

**Summary** The exit instruction causes the macro to continue with out doing some or all of the remaining instructions. Exit Description All Exit all macros. Do Exit the Do loop. For Exit the For of For Each loop.

---

**Declaration** Exit { All|Do|For|Function|Property|Sub|While }

**Example**

```
Sub Main
    L$ = InputBox$("Enter Do, For, While, Sub or All:")
    Debug.Print "Before DoSub"
    DoSub UCase$(L$)
    Debug.Print "After DoSub"
End Sub

Sub DoSub(L$)
    Do
        If L$ = "DO" Then Exit Do
        I = I+1
    Loop While I < 10
    If I = 0 Then Debug.Print "Do was entered"

    For I = 1 To 10
        If L$ = "FOR" Then Exit For
    Next I
    If I = 1 Then Debug.Print "For was entered"

    I = 10
    While I > 0
        If L$ = "WHILE" Then Exit While
        I = I-1
    Wend
    If I = 10 Then Debug.Print "While was entered"

    If L$ = "SUB" Then Exit Sub
```

```
    Debug.Print "Sub was not entered."  
  
    If L$ = "ALL" Then Exit All  
  
    Debug.Print "All was not entered."  
  
End Sub
```

Group [MMP Flow Control Commands](#)

## 11. For Statement

**Summary** Execute statements while Num is in the range First to Last. Parameter Description Num This is the iteration variable. First Set Num to this value initially. Last Continue looping while Num is in the range. See Step below. Step If this numeric value is greater than zero then the for loop continues as long as Num is less than or equal to Last. If this numeric value is less than zero then the for loop continues as long as Num is greater than or equal to Last. If this is omitted then one is used.

**Declaration** For Num = First To Last [Step Inc] statements Next [Num]

### Example

```
Sub Main  
  
    For I = 1 To 2000 Step 100  
  
        Debug.Print I;I+I;I*I  
  
    Next I  
  
End Sub
```

Group [MMP Flow Control Commands](#)

## 12. For Each Statement

**Summary** Execute statements for each item in items. Parameter Description var This is the iteration variable. items This is the collection of items to be done.

**Declaration** For Each var In items statements Next [var]

### Example

```
Sub Main  
  
    Dim Document As Object  
  
    For Each Document In App.Documents  
  
        Debug.Print Document.Title  
  
    Next Document  
  
End Sub
```

Next Document

End Sub

Group [MMP Flow Control Commands](#)

## 13. Function Definition

**Summary** User defined function. The function defines a set of statements to be executed when it is called. The values of the calling arglist are assigned to the params. Assigning to name[type] sets the value of the function result. Function defaults to Public if Private, Public or Friend are not is specified.

**Declaration** [ | Private | Public | Friend ] \_ [ Default ] \_ Function name[type][([param[, ...]])] [As type[()]] statements End Function

### Example

```
Function Power(X,Y)
    P = 1
    For I = 1 To Y
        P = P*X
    Next I
    Power = P
End Function

Sub Main
    Debug.Print Power(2,8) ' 256
End Sub
```

Group [MMP Declaration Commands](#)

## 14. Goto Instruction

**Summary** Go to the label and continue execution from there. Only labels in the current user defined procedure are accessible.

**Declaration** GoTo label

### Example

```
Sub Main
    X = 2
Loop:
    X = X*X
    If X < 100 Then GoTo Loop
    Debug.Print X ' 256
End Sub
```

Group [MMP Flow Control Commands](#)

## 15. If Statement

### Summary

**Declaration** If condexpr Then [instruction] [Else instruction] -or- If condexpr Then statements [ElseIf condexpr Then statements]... [Else statements] End If -or- If TypeOf objexpr Is objtype Then ...

### Example

```
Sub Main
    S = InputBox("Enter hello, goodbye, dinner or sleep:")
    S = UCase(S)
    If S = "HELLO" Then Debug.Print "come in"
    If S = "GOODBYE" Then Debug.Print "see you later"
    If S = "DINNER" Then
        Debug.Print "Please come in."
        Debug.Print "Dinner will be ready soon."
    ElseIf S = "SLEEP" Then
        Debug.Print "Sorry."
        Debug.Print "We are full for the night"
    End If
End Sub
```

Group [MMP Flow ControlForm 1: Single line if statement. Execute the instruction following the Then if condexpr is True. Otherwise, execute the instruction following the Else. The Else portion is optional. Commands](#)

## 16. InputBox\$ Function

**Summary** Display an input box where the user can enter a line of text. Pressing the OK button returns the string entered. Pressing the Cancel button returns a null string. **Parameter Description** Prompt\$ Use this string value as the prompt in the input box. Title\$ Use this string value as the title of the input box. If this is omitted then the input box does not have a title. Default\$ Use this string value as the initial value in the input box. If this is omitted then the initial value is blank. XPos When the dialog is put up the left edge will be at this screen position. If this is omitted then the dialog will be centered. YPos When the dialog is put up the top edge will be at this screen position. If this is omitted then the dialog will be centered.

**Declaration** InputBox\$(Prompt\$[, Title\$][, Default\$][, XPos, YPos])

### Example

```
Sub Main
    L$ = InputBox$("Enter some text:", _
        "Input Box Example", "asdf")
    Debug.Print L$
End Sub
```

Integer Data Type

Group: Data Type

Description:

A 16 bit integer value.

Group [MMP User Input Commands](#)

## 17. LBound Function

**Summary** Return the lowest index. **Parameter Description** arrayvar Return the lowest index for this array variable. dimension Return the lowest index for this dimension of arrayvar. If this is omitted then return the lowest index for the first dimension.

**Declaration** LBound(arrayvar[, dimension])

### Example

```
Sub Main
    Dim A(-1 To 3, 2 To 6)
    Debug.Print LBound(A)    '-1
    Debug.Print LBound(A, 1) '-1
```

```
        Debug.Print LBound(A,2) ' 2
End Sub
```

Group [MMP Variable Info Commands](#)

## 18. Main Sub

**Summary** Form 1: Each macro must define Sub Main. A macro is a "program". Running a macro starts the Sub Main and continues to execute until the subroutine finishes.

Form 2: A code module may define a Private Sub Main. This Sub Main is the code module initialization subroutine. If Main is not defined then no special initialization occurs.

**Declaration** Sub Main() ... End Sub -or- Private Sub Main() ... End Sub

### Example

```
Sub Main
    MsgBox "Please press OK button"
    If MsgBox("Please press OK button",vbOkCancel) = vbOK Then
        Debug.Print "OK was pressed"
    Else
        Debug.Print "Cancel was pressed"
    End If
End Sub
```

Group [MMP Declaration Commands](#)

## 19. MsgBox Instruction/Function

**Summary** Show a message box titled Title\$. Type controls what the message box looks like (choose one value from each category). Use MsgBox( ) if you need to know what button was pressed. The result indicates which button was pressed. Result Value Button Pressed vbOK 1 OK button vbCancel 2 Cancel button vbAbort 3 Abort button vbRetry 4 Retry button vbIgnore 5 Ignore button vbYes 6 Yes button vbNo 7 No button Parameter Description Message\$ This string value is the text that is shown in the message box. Type This numeric value controls the type of message box. Choose one value from each of the following tables. Title\$ This string value is the title of the message box. Button Value Effect vbOkOnly 0 OK button vbOkCancel 1 OK and Cancel buttons vbAbortRetryIgnore 2 Abort, Retry, Ignore buttons vbYesNoCancel 3 Yes, No, Cancel buttons vbYesNo 4 Yes and No buttons vbRetryCancel 5 Retry and Cancel buttons Icon Value Effect 0 No icon vbCritical 16 Stop icon vbQuestion 32 Question icon vbExclamation 48 Attention icon vbInformation 64 Information icon Default Value Effect vbDefaultButton1 0 First button vbDefaultButton2 256 Second button vbDefaultButton3 512 Third button Mode Value Effect vbApplicationModal 0 Application modal vbSystemModal 4096 System modal vbMsgBoxSetForeground &h10000 System modal

---

**Declaration** MsgBox Message\$[, Type][, Title\$] -or- MsgBox(Message\$[, Type][, Title\$])

**Example**

```

Sub Main
MsgBox "Please press OK button"
If MsgBox("Please press OK button",vbOkCancel) = vbOK Then
Debug.Print "OK was pressed"
Else
Debug.Print "Cancel was pressed"
End If
End Sub

```

**Group** [MMP User Input Commands](#)

**20. On Error Instruction****Summary**

**Declaration** On Error GoTo 0 -or- On Error GoTo label -or- On Error Resume Next

**Example**

```

Sub Main
    On Error Resume Next
    Err.Raise 1
    Debug.Print "RESUMING, Err=";Err
    On Error GoTo X
    Err.Raise 1
    Exit Sub

X: Debug.Print "Err=";Err
    Err.Clear
    Debug.Print "Err=";Err
    Resume Next

```

End Sub

Group [MMP Error Handling Form 1: Disable the error handler \(default\). Commands](#)

## 21. Operators

**Summary** These operators are available for numbers n1 and n2 or strings s1 and s2. If any value in an expression is Null then the expression's value is Null. The order of operator evaluation is controlled by operator precedence. Operator Description - n1 Negate n1. n1 ^ n2 Raise n1 to the power of n2. n1 \* n2 Multiply n1 by n2. n1 / n2 Divide n1 by n2. n1 \ n2 Divide the integer value of n1 by the integer value of n2. n1 Mod n2 Remainder of the integer value of n1 after dividing by the integer value of n2. n1 + n2 Add n1 to n2. s1 + s2 Concatenate s1 with s2. n1 - n2 Difference of n1 and n2. s1 & s2 Concatenate s1 with s2. n1 < n2 Return True if n1 is less than n2. n1 <= n2 Return True if n1 is less than or equal to n2. n1 > n2 Return True if n1 is greater than n2. n1 >= n2 Return True if n1 is greater than or equal to n2. n1 = n2 Return True if n1 is equal to n2. n1 <> n2 Return True if n1 is not equal to n2. s1 < s2 Return True if s1 is less than s2. s1 <= s2 Return True if s1 is less than or equal to s2. s1 > s2 Return True if s1 is greater than s2. s1 >= s2 Return True if s1 is greater than or equal to s2. s1 = s2 Return True if s1 is equal to s2. s1 <> s2 Return True if s1 is not equal to s2. Not n1 Bitwise invert the integer value of n1. Only Not True is False. n1 And n2 Bitwise and the integer value of n1 with the integer value n2. n1 Or n2 Bitwise or the integer value of n1 with the integer value n2. n1 Xor n2 Bitwise exclusive-or the integer value of n1 with the integer value n2. n1 Eqv n2 Bitwise equivalence the integer value of n1 with the integer value n2 (same as Not (n1 Xor n2)). n1 Imp n2 Bitwise implicate the integer value of n1 with the integer value n2 (same as (Not n1) Or n2).

**Declaration** ^ Not \* / \ Mod + - & < <= > >= = <> Is And Or Xor Eqv Imp

### Example

```
Sub Main
    N1 = 10
    N2 = 3
    S1$ = "asdfg"
    S2$ = "hjkl"
    Debug.Print -N1           '-10
    Debug.Print N1 ^ N2      ' 1000
    Debug.Print Not N1      '-11
    Debug.Print N1 * N2     ' 30
    Debug.Print N1 / N2     ' 3.33333333333333
    Debug.Print N1 \ N2     ' 3
    Debug.Print N1 Mod N2   ' 1
    Debug.Print N1 + N2     ' 13
```

```
Debug.Print S1$ + S2$  "asdfghjkl"  
Debug.Print N1 - N2    ' 7  
Debug.Print N1 & N2    '"103"  
Debug.Print N1 < N2    'False  
Debug.Print N1 <= N2   'False  
Debug.Print N1 > N2    'True  
Debug.Print N1 >= N2   'True  
Debug.Print N1 = N2    'False  
Debug.Print N1 <> N2   'True  
Debug.Print S1$ < S2$  'True  
Debug.Print S1$ <= S2$ 'True  
Debug.Print S1$ > S2$  'False  
Debug.Print S1$ >= S2$ 'False  
Debug.Print S1$ = S2$  'False  
Debug.Print S1$ <> S2$ 'True  
Debug.Print N1 And N2  ' 2  
Debug.Print N1 Or N2   ' 11  
Debug.Print N1 Xor N2  ' 9  
Debug.Print N1 Eqv N2  ' -10  
Debug.Print N1 Imp N2  ' -9
```

```
End Sub
```

Group [MMP Operator Commands](#)

## 22. Option Definition

**Summary** Require all variables to be declared prior to use. Variables are declared using Dim, Private, Public, Static or as a parameter of Sub, Function or Property blocks.

**Declaration** Option Explicit

**Example**

```
Option Explicit
```

```
Sub Main
    Dim A
    A = 1
    B = 2 ' B has not been declared
End Sub
```

Private Keyword

Group: Declaration

Description:

Private Consts, Declares, Functions, Propertyts, Subs and Types are only available in the current macro/module.

Public Keyword

Group: Declaration

Description:

Public Consts, Declares, Functions, Propertyts, Subs and Types in a module are available in all other macros/modules that access it.

Group [MMP Declaration Commands](#)

## 23. ReDim Instruction

**Summary** Redimension a dynamic arrayvar or user defined type array element. Use Preserve to keep the array values. Otherwise, the array values will all be reset. When using preserve only the last index of the array may change, but the number of indexes may not. (A one-dimensional array can't be redimensioned as a two-dimensional array.)

**Declaration** ReDim [Preserve] name[type][([dim[, ...]])] [As type][, ...] -or- ReDim [Preserve] usertypevar.elem[type][([dim[, ...]])] [As type][, ...]

### Example

```
Sub Main
    Dim X()
    ReDim X(3)
    Debug.Print UBound(X) ' 3
    ReDim X(200)
```

```

    Debug.Print UBound(X) ' 200
End Sub

```

Group [MMP Declaration Commands](#)

## 24. Select Case Statement

**Summary** Select the appropriate case by comparing the expr with each of the caseexprs. Select the Case Else part if no caseexpr matches. (If the Case Else is omitted then skip the entire Select...End Select block.) caseexpr Description expr Execute if equal. Is < expr Execute if less than. Is <= expr Execute if less than or equal to. Is > expr Execute if greater than. Is >= expr Execute if greater than or equal to. Is <> expr Execute if not equal to. expr1 To expr2 Execute if greater than or equal to expr1 and less than or equal to expr2.

**Declaration** Select Case expr [Case caseexpr[, ...] statements]... [Case Else statements] End Select

### Example

```

Sub Main
    S = InputBox("Enter hello, goodbye, dinner or sleep:")
    Select Case UCase(S)
    Case "HELLO"
        Debug.Print "come in"
    Case "GOODBYE"
        Debug.Print "see you later"
    Case "DINNER"
        Debug.Print "Please come in."
        Debug.Print "Dinner will be ready soon."
    Case "SLEEP"
        Debug.Print "Sorry."
        Debug.Print "We are full for the night"
    Case Else
        Debug.Print "What?"
    End Select
End Sub

## 27. Sub Definition

**Summary** User defined subroutine. The subroutine defines a set of statements to be executed when it is called. The values of the calling arglist are assigned to the params. A subroutine does not return a result. Sub defaults to Public if Private, Public or Friend are not is specified.

**Declaration** [ | Private | Public | Friend ] \_ Sub name([[param[, ...]]) statements End Sub

### Example

```

Sub IdentityArray(A()) ' A() is an array of numbers
    For I = LBound(A) To UBound(A)
        A(I) = I
    Next I
End Sub

```

```

Sub CalcArray(A(),B,C) ' A() is an array of numbers
    For I = LBound(A) To UBound(A)
        A(I) = A(I)*B+C
    Next I
End Sub

```

```

Sub ShowArray(A()) ' A() is an array of numbers
    For I = LBound(A) To UBound(A)
        Debug.Print "(";I;"=";A(I)
    Next I

```

```
End Sub
```

```
Sub Main
```

```
Dim X(1 To 4)
```

```
IdentityArray X() ' X(1)=1, X(2)=2, X(3)=3, X(4)=4
```

```
CalcArray X(),2,3 ' X(1)=5, X(2)=7, X(3)=9, X(4)=11
```

```
ShowArray X() ' print X(1), X(2), X(3), X(4)
```

```
End Sub
```

Group [MMP Declaration Commands](#)

## 28. UBound Function

**Summary** Return the highest index. Parameter Description arrayvar Return the highest index for this array variable. dimension Return the highest index for this dimension of arrayvar. If this is omitted then return the highest index for the first dimension.

**Declaration** UBound(arrayvar[, dimension])

**Example**

```
Sub Main
```

```
Dim A(3,6)
```

```
Debug.Print UBound(A) ' 3
```

```
Debug.Print UBound(A,1) ' 3
```

```
Debug.Print UBound(A,2) ' 6
```

```
End Sub
```

Group [MMP Variable Info Commands](#)

## 29. Wait Instruction

**Summary** Wait for Delay seconds.

**Declaration** Wait Delay

**Example**

```
Sub Main
```

```
    Wait 5 ' wait for 5 seconds
End Sub
```

Group [MMP Miscellaneous Commands](#)

### 30. While Statement

**Summary** Execute statements while condexpr is True.

**Declaration** While condexpr statements Wend

**Example**

```
Sub Main
    I = 2
    While I < 10
        I = I*2
    Wend
    Debug.Print I ' 16
End Sub
```

## SLA Commands Reference

Following are the SLA Commands which can be used in a Multi Motor Program (MMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access. All the SLA commands can be used in a MMP program by using "sla." namespace (type CTRL-SPACE after typing sla. in the MMP Programming environment.)

---

### SLA Commands in Related Groups

The SLA Commands are categorized in each group depending on their functionalities.

- **SLA Initialization Commands**

These commands are used in setting the initial environment before a program can be successfully started. They are usually called in the initialization method before any other command is executed.

- [Calibrate](#)
- [Reset](#)

- **SLA Motion Commands**

These commands are used to move the slides to specified positions or along the specified paths. They also contain commands to obtain the useful information regarding positions to move to.

- [BeginningPathPoint](#)
- [CurrentPoint](#)
- [DoLine](#)
- [DoPath](#)
- [DoPositionMove](#)
- [DoRelativeMove](#)
- [DoVelocityMove](#)
- [MaxOfPath](#)
- [MinOfPath](#)
- [StopMotion](#)
- [WaitForStop](#)

- **SLA I/O Commands**

These commands are used to control the I/O switches. They can be used to control the integrated I/O as well as externally supplied unit.

- [CheckSwitch](#)
- [SetSwitch](#)
- [WaitForSwitch](#)

- **SLA Motor Commands**

These commands directly related to individual motors that drive the slides. They can be used to obtain useful status information regarding motors.

- [MotorStatus](#)
- [RunDiagnostics](#)
- [SetServoOff](#)

- **SLA Multi Tasking Commands**

These commands can be used to launch multiple programs simultaneously. These programs run at the same time and can be very useful where multi-tasking capability is needed.

- [StartProgram](#)
- [StopProgram](#)

- **SLA State Management Commands**

These commands can be used to maintain the custom state information in the shared memory space which can be optionally made persistent (saved on the disk). The shared memory can be used by multiple tasks to communicate among themselves.

- [GetValue](#)
- [RemoveValue](#)
- [SaveValue](#)

- **SLA Axis Transformation Commands**

These commands can be used for axis transformations of the existing position data for reusing in different reference frames. These commands have the chaining capability to combine multiple transformations for very powerful results.

- [AppendPaths](#)
- [ApplyTransformation](#)
- [ApplyTransformationToDataset](#)
- [ApplyTransformationToPath](#)
- [ApplyTransformationToPoint](#)
- [CurrentCoordinateSystem](#)
- [ReflectAxis](#)
- [ReversePath](#)
- [RotateAxis](#)
- [RotateAxisAroundPoint](#)
- [ScaleAxis](#)

- [ShiftAxis](#)

- **SLA Instrumentation Commands**

These commands can be used to measure time profile behavior of a program. They have capabilities to profile multiple sections of the running program at the same time.

- [ElapsedTimer](#)
- [StartTimer](#)

- **SLA Miscellaneous Commands**

These commands provide additional capabilities to augment the existing powerful command set.

- [LogMessage](#)
  - [SendMail](#)
- 

## SLA Commands in Alphabetic Order

1. [AppendPaths](#)
2. [ApplyTransformation](#)
3. [ApplyTransformationToDataset](#)
4. [ApplyTransformationToPath](#)
5. [ApplyTransformationToPoint](#)
6. [BeginningPathPoint](#)
7. [Calibrate](#)
8. [CheckSwitch](#)
9. [CurrentCoordinateSystem](#)
10. [CurrentPoint](#)
11. [DoLine](#)
12. [DoPath](#)
13. [DoPositionMove](#)
14. [DoRelativeMove](#)
15. [DoVelocityMove](#)
16. [ElapsedTimer](#)
17. [GetValue](#)
18. [LogMessage](#)
19. [MaxOfPath](#)
20. [MinOfPath](#)
21. [MotorStatus](#)
22. [ReflectAxis](#)
23. [RemoveValue](#)
24. [Reset](#)
25. [ReversePath](#)
26. [RotateAxis](#)

- 
27. [RotateAxisAroundPoint](#)
  28. [RunDiagnostics](#)
  29. [SaveValue](#)
  30. [ScaleAxis](#)
  31. [SendMail](#)
  32. [SetServoOff](#)
  33. [SetSwitch](#)
  34. [ShiftAxis](#)
  35. [StartProgram](#)
  36. [StartTimer](#)
  37. [StopMotion](#)
  38. [StopProgram](#)
  39. [WaitForStop](#)
  40. [WaitForSwitch](#)
- 

## SLA Commands

[note: In the example snippets shown below, *MyDataset* is the name of a dataset created by user. *path1*, *path2* etc. are the names of the paths in the *MyDataset* which can be accessed using the fully qualified names *MyDataset.path1*, *MyDataset.path2* etc. And, *point1*, *point2* etc. are the points in the *MyDataset* which can be accessed using the fully qualified name *MyDataset.point1*, *MyDataset.point2* etc.]

### 1. AppendPaths

**Summary** Append the paths defined in a dataset to create a concatenated path.

**Declaration** `AppendPaths(first As Path, Optional second As Path)`

**Return** Returns appended path.

**Description** `AppendPaths` command appends second path to the first path and returns reference to first path. If optional second path is not specified, it removes all appended paths from the first path if any. Since it returns the first path, the return value can be used to append subsequent paths as shown in the following example.

**Example** Following example appends `path2` and `path3` to `path1` and returns `path1`. Note that it is necessary to remove any earlier appended paths from `path1` to prevent continuous chaining of the paths from the earlier calls.

```

sla.AppendPaths(MyDataset.path1, Nothing) 'remove
any earlier appended paths

sla.AppendPaths(sla.AppendPaths(MyDataset.path1,
MyDataset.path2), MyDataset.path3)

sla.DoPath (MyDataset.path1, 100, 1000, 5)

```

**Group** [SLA Axis Transformation Commands](#)

## 2. ApplyTransformation

**Summary** Apply transformation to all position data.

**Declaration** ApplyTransformation ()

**Return** No return value.

**Description** ApplyTransformation command applies the transformations to all the datasets. This could potentially be expensive operation and it is recommended that the more specific commands ApplyTransformationToPoint, ApplyTransformationToPath or ApplyTransformationToDataset be used depending on the position data of interest. Until any of the ApplyTransformation\* commands are applied, the transformations do not affect any of the position data.

**Example** Following example applies transformation to all the paths and points (in all datasets).

```
sla.ApplyTransformation()
```

Group [SLA Axis Transformation Commands](#)

## 3. ApplyTransformationToDataset

**Summary** Apply transformation to the specified dataset.

**Declaration** ApplyTransformationToDataset(datasetToTransform As DataSet)

**Return** No return value.

**Description** ApplyTransformationToDataset command applies the transformation to all the paths and points contained in the specified dataset. If only few paths or points out of all the existing paths and points in a dataset are required to transform, consider using the more specific ApplyTransformationToPath or ApplyTransformationToPoint commands to reduce the transformation time.

**Example** Following example applies transformation to all the paths and points in MyDataset.

```
sla.ApplyTransformationToDataset(MyDataset)
```

Group [SLA Axis Transformation Commands](#)

## 4. ApplyTransformationToPath

**Summary** Apply transformation to the specified path.

**Declaration** ApplyTransformationToPath(pathToTransform As Path)

**Return** No return value.

**Description** ApplyTransformationToPath command applies the transformation to the specified path.

**Example** Following example applies transformation to the specified MyDataset.path1.

```
sla.ApplyTransformationToPath(MyDataset.path1)
```

Group [SLA Axis Transformation Commands](#)

## 5. ApplyTransformationToPoint

**Summary** Apply transformation to the specified point.

**Declaration** ApplyTransformationToPoint(pointToTransform As Point)

**Return** No return value.

**Description** ApplyTransformationToPoint command applies the transformation to the specified point.

**Example** Following example applies transformation to the specified MyDataset.point1.

```
sla.ApplyTransformationToPoint(MyDataset.point1)
```

Group [SLA Axis Transformation Commands](#)

## 6. BeginningPathPoint

**Summary** Return the beginning point of the specified path.

**Declaration** BeginningPathPoint(specifiedPath As Path)

**Return** Returns the beginning point.

**Description** BeginningPathPoint command returns the first point of a path which can be used to move to the beginning of the path. If the path is linear then it returns the first point on the path, while for an arc, it returns the beginning point of the arc. The returned point can be stored in a Point type variable and can be subsequently used wherever a command takes Point as an argument e.g. [DoLine](#).

**Example** Following example returns the first point of MyDataset.path1..

```
Dim beginningPoint as Point
Set beginningPoint =
sla.BeginningPathPoint(MyDataset.path1)
```

Group [SLA Motion Commands](#)

## 7. Calibrate

**Summary** Calibrate the motors by homing them in the desired direction.

**Declaration** Calibrate(Optional motorIndex As Integer, Optional direction As Integer, Optional force As Boolean, Optional speed As Double, Optional acceleration As Double)

**Return** No return value.

**Description** Calibrate command homes a motor in either direction (-1 for negative direction towards the motor (default), +1 for positive direction away from the Motor). Once calibrated, a motor won't home again unless the optional force parameter is specified as True. motorIndex parameter can be 0 for homing all motors, or a particular motor (1, 2 or 3) can be specified for homing only one motor. If no values are specified, the command will home all motors in the negative direction only if they haven't been homed earlier. The optional speed and acceleration parameters can be used to control the speed of homing.

**Example** Following example performs homing of motorX in positive direction irrespective of whether it was done earlier.

```
sla.Calibrate(1, 1, True)
```

Group [SLA Initialization Commands](#)

## 8. CheckSwitch

**Summary** Check the status of an inputSwitch or outputSwitch.

**Declaration** CheckSwitch(motorIndex As Integer, switchName As String, Optional isInputSwitch As Boolean)

**Return** Return the state (0 for off, 1 for on) of the switch.

**Description** CheckSwitch command gets the status of the switch on the indicated IO unit. The optional parameter isInputSwitch (True by default) determines whether it is input or output switch. The motorIndex parameter could be any of the motors (1, 2 or 3) or external IO indicated by 0. The switch names can be defined on the configuration screen. The returned value is either 0 (for switch in low/off status) or 1 (for switch in high/on status).

**Example** Following examples show how to obtain the switch status for different devices. In the first example the command retrieves the value of "MotorX\_Input\_Switch" located on motorX. In the second example the command retrieves the value of "External\_IO\_Output\_Switch" located on external IO unit (optional).

```
Dim motorInputSwitchStatus as Integer

motorInputSwitchStatus = sla.CheckSwitch (1,
"MotorX_Input_Switch")

Dim externalOutputSwitchStatus as Integer

externalOutputSwitchStatus = sla.CheckSwitch (0,
"External_IO_Input_Switch", False)
```

Group [SLA I/O Commands](#)

## 9. CurrentCoordinateSystem

**Summary** Set the current coordinate system.

**Declaration** CurrentCoordinateSystem (systemName As String)

**Return** Returns True or False depending on the success or failure of the command.

**Description** CurrentCoordinateSystem command changes the current coordinate system. Valid values are "WORLD" or "USER". Set coordinate system to "WORLD" to use the original (untransformed) data points. Set coordinate system to "USER" to use the transformed data points.

**Example** Following example changes the coordinate system to "USER"

```
sla.CurrentCoordinateSystem ("USER")
```

Group [SLA Axis Transformation Commands](#)

## 10. CurrentPoint

**Summary** Return the current location.

**Declaration** CurrentPoint()

**Return** Returns a point representing current location.

**Description** CurrentPoint command returns the current location. Individual axis values can be obtained by accessing the members of the returned point.

**Example** Following example stores the current value of motorX in currentX variable.

```
Dim currentX as Double
currentX = sla.CurrentPoint().x
```

Group [SLA Motion Commands](#)

## 11. DoLine

**Summary** Move a point in linear trajectory using coordinated motion.

**Declaration** DoLine(endPoint As Point, speed As Double, acceleration As Double)

**Return** No return value.

**Description** DoLine command moves the current point in linear motion to the specified destination with given speed and acceleration. The command blocks the program execution till the motion is completed.

**Example** Following example will move the slides to MyDataset.point1 from current location with speed 100 and acceleration 1000

```
sla.DoLine (MyDataset.point1, 100, 1000)
```

Group [SLA Motion Commands](#)

## 12. DoPath

**Summary** Move a point along a user defined path using coordinated motion.

**Declaration** DoPath(pathToMoveAlong As Path, speed As Double, acceleration As Double, Optional cornerRadius As Double)

**Return** No return value.

**Description** DoPath command moves the current point along the user defined path with given speed and acceleration. A path can be a linear path (made up of connected straight lines) or an arc path (arc of a circle). For a linear path, the optional cornerRadius argument can be used to specify any desired rounding of the corners. The corners where the rounding can not be achieved, the cornerRadius argument will have no effect. The rounding of the corners helps with a smoother trajectory, thus helping to reduce any vibration which can be present due to sudden change in direction. This rounding works in all geometries including three dimensional paths. The command blocks the program execution till the motion is completed.

**Example** Following example moves the point along the MyDataset.path1 with speed 100 and acceleration 1000 rounding the corners with arc of 5 units wherever possible.

```
sla.DoPath (MyDataset.myPath, 100, 1000, 5)
```

Group [SLA Motion Commands](#)

## 13. DoPositionMove

**Summary** Do position move to the specified location.

**Declaration** DoPositionMove(motorIndex As Integer, absolutePosition As Double, speed As Double, acceleration As Double)

**Return** No return value.

**Description** DoPositionMove command moves a motor to the specified absolutePosition with given speed and acceleration for the motor indicated by motorIndex. Valid values of motorIndex are 1 for motorX, 2 for motorY and 3 for motorZ. This is a non-blocking command and the program execution will continue even while the motion is in progress. This is useful in optimizing cycle times by not waiting for a motor to stop. To wait till the motion is complete, use it in combination with [WaitForStop](#) command.

**Example** Following example moves motorX to position 50 with speed 100 and acceleration 1000.

```
sla.DoPositionMove(1, 50, 100, 1000)
```

---

Group [SLA Motion Commands](#)

## 14. DoRelativeMove

**Summary** Do relative move from the current position in given direction.

**Declaration** DoRelativeMove(motorIndex As Integer, relativeMoveDistance As Double, speed As Double, acceleration As Double)

**Return** No return value.

**Description** DoRelativeMove command moves a motor in either direction by specified relativeMoveDistance (positive value moves in positive direction, negative value moves in negative direction) with given speed and acceleration for the motor indicated by motorIndex. Valid values of motorIndex are 1 for motorX, 2 for motorY and 3 for motorZ. This is a non-blocking command and the program execution will continue even while the motion is in progress. This is useful in optimizing cycle times by not waiting for a motor to stop. To wait till the motion is complete, use it in combination with [WaitForStop](#) command.

**Example** Following example moves motorX in positive direction by 50 with speed 100 and acceleration 1000.

```
sla.DoRelativeMove(1, 50, 100, 1000)
```

Group [SLA Motion Commands](#)

## 15. DoVelocityMove

**Summary** Do constant velocity move for a motor in given direction.

**Declaration** DoVelocityMove(motorIndex As Integer, direction As Integer, speed As Double, acceleration As Double)

**Return** No return value.

**Description** DoVelocityMove command moves a motor in either direction (+1 for positive direction, -1 for negative direction) with given speed and acceleration for the motor indicated by motorIndex. Valid values of motorIndex are 1 for MotorX, 2 for MotorY and 3 for MotorZ. This is a non-blocking command and the program execution will continue even while the motion is in progress. This is useful in optimizing cycle times by not waiting for a motor to stop. To wait till the motion is complete, use it in combination with [WaitForStop](#) command.

**Example** Following examples moves the motorX in negative direction with speed 100 and acceleration 1000 till it stops (hits the limit switch).

```
sla.DoVelocityMove(1, -1, 100, 1000)
```

Group [SLA Motion Commands](#)

## 16. ElapsedTimer

**Summary** Return the elapsed time for the timer.

**Declaration** ElapsedTimer(timerKey As String, Optional resetTimer As Boolean)

**Return** Returns elapsed time in seconds since the start of the timer.

**Description** ElapsedTimer command returns the time in seconds since the start of the timer. First the timer with the same timerKey has to be started using StartTimer command for this command to work. If optional resetTimer argument is specified to be True (default is False), then the timer will reset it. This can be useful while using the same timer for multiple measurements.

**Example** Following example assigns the myTimer's current value to elapsedTime variable and resetting the timer.

```
Dim elapsedTime as Double
elapsedTime = sla.ElapsedTimer("myTimer", True)
```

Group [SLA Instrumentation Commands](#)

## 17. GetValue

**Summary** Get a stored state using the key.

**Declaration** GetValue(key As String)

**Return** Returns stored value associated with the key as String.

**Description** GetValue command retrieves the earlier stored value using the specified key. The returned value can be cast back to its original type using appropriate CDbI(), CInt(), CLng(), CSng() or CBool() functions which take a String as the argument. If no stored values are found for the specified key, an empty string is returned.

**Example** Following is an example of getting a stored Integer value with "result" as the key.

```
Dim value as Integer
value = CInt(sla.GetValue("result"))
```

Group [SLA State Management Commands](#)

## 18. LogMessage

**Summary** Log a message with given log level.

**Declaration** LogMessage (message As String, Optional level As Integer)

**Return** No return value.

**Description** Logs a message to log window as well as logs.txt file located by default at C:\Program Files\Robohand\SLA\logs\logs.txt with the given log level. Depending on the log level value, the message is highlighted in different colors in the log window. The valid log level values are 1 (information), 2 (warning) or 3 (error).

**Example** Following is an example for logging message at information level.

```
sla.LogMessage("This is an example log message
for information", 1)
```

Group [SLA Miscellaneous Commands](#)

## 19. MaxOfPath

**Summary** Get the maximum value of specified axis for the path.

**Declaration** MaxOfPath(path As Path, axis As Integer)

**Return** Returns maximum value of specified axis for any point in the path as Double.

**Description** MaxOfPath command gets the maximum value of specified axis (1, 2, or 3) for the path. This is useful in defining the envelope of operation.

**Example** Following is an example of getting maximum Y axis value in MyDataset.path1 and assigning it to maxY variable.

```
Dim maxY as Double
maxY = sla.MaxOfPath(MyDataset.path1, 2)
```

Group [SLA Motion Commands](#)

## 20. MinOfPath

**Summary** Get the minimum value of specified axis for the path.

**Declaration** MinOfPath (path As Path, axis As Integer)

**Return** Returns minimum value of specified axis for any point in the path as Double.

**Description** MinOfPath command gets the minimum value of specified axis (1, 2, or 3) for the path. This is useful in defining the envelope of operation.

**Example** Following is an example of getting minimum X axis value in MyDataset.path1 and assigning it to minX variable.

```
Dim minX as Double
minX = sla.MinOfPath(MyDataset.path1, 1)
```

Group [SLA Motion Commands](#)

## 21. MotorStatus

**Summary** Get and set the motor status information.

**Declaration** MotorStatus(motorIndex As Integer)

**Return** Returns an object of MotorStatus type.

**Description** MotorStatus command returns an object of MotorStatus type which encompasses the relevant status flags information for the specified motorIndex. Valid values of motorIndex are 1 for MotorX, 2 for MotorY and 3 for MotorZ. Individual status flag value can be obtained by accessing the members of the returned object. Currently available status flags are as follows and meaning of the flags when they are True.

Ba - over current state  
Bd - user math overflow  
Be - excessive position error  
Bh - excessive temperature (real time)  
Bk - over current state (real time)  
Bm - left limit (real time)  
Bo - motor off (real time)  
Bp - right limit (real time)  
Bs - syntax error  
Bt - trajectory in progress (real time)  
Bu - user array index range error

Apart from these statuses, additional motor status information available is:

MaxCurrent - maximum current limit (0 to 1023, default = 1000). In some applications, if the motor is misapplied full power, the attached mechanism could be damaged. It can be useful to reduce the maximum amount of current available thus limiting the torque the motor can put out.

MaxPositionError - maximum position error (1 to 32000, default = 1000). The difference between where the motor shaft is and where it is supposed to be is appropriately called the 'error'. The magnitude and sign of the error is delivered to the motor in the form of torque, after it is put through the PID filter. The higher the error, the more out of control the motor is. Therefore, it is often useful to put a limit on the allowable error, after which time the motor will be turned off.

Calibration - It returns true/false depending on whether the motor has been calibrated or not. This information can be used to alert an operator before proceeding with the calibration.

**Example** Following example retrieves value of Bt (whether motor trajectory in progress) for MotorX and stores it in isMoving Boolean variable. The second example sets the maximum position error 500 on MotorX which will trigger position error at much tighter variations.

```
Dim isMoving as Boolean  
  
isMoving = sla.MotorStatus(1).Bt  
  
sla.MotorStatus(1).MaxPositionError = 500
```

---

Group [SLA Motor Commands](#)

## 22. ReflectAxis

**Summary** Reflect specified axis.

**Declaration** ReflectAxis(Optional xReflection As Boolean, Optional yReflection As Boolean, Optional zReflection As Boolean , Optional isChained As Boolean)

**Return** No return value.

**Description** ReflectAxis command multiplies -1 to the x, y or z axis values in the WORLD coordinate system to create transformed values in the USER coordinate system. Since each of the reflection is optional, it is possible to perform reflection only in the desired coordinate. Using the optional isChained argument (False by default), the reflect transformation can be chained with any earlier defined transformation to create a more complex combined transformation. A transformation has to be explicitly applied to the position data using one of the ApplyTransformation\* command to have any effect on the motion. It is useful to note that the same effect can be achieved by using [ScaleAxis](#) command with scaleFactor of -1.

**Example** Following example shows how to reflect y axis values and remove any of the earlier transformations by specifying isChained as False. The equivalent command using ScaleAxis is also shown below.

```
sla.ReflectAxis (False, True, False, False)
sla.ScaleAxis(1, -1, 1, False)
```

Group [SLA Axis Transformation Commands](#)

## 23. RemoveValue

**Summary** Remove a state from memory and persistent storage (if optionally stored).

**Declaration** RemoveValue(key As String)

**Return** No return value.

**Description** RemoveValue command removes an earlier stored value associated with the key. If the value was also stored in persistent storage, that value is removed as well. If the value is not removed it continues to be available to all the programs till the SLA Operating Software terminates. It is recommended that any unused persistent values be removed to save disk space.

**Example** Following is an example of removing a stored value with "result" as the key.

```
sla.RemoveValue("result")
```

Group [SLA State Management Commands](#)

## 24. Reset

**Summary** Reset the SLA Operating Software.

**Declaration** Reset()

**Return** No return value.

**Description** Reset command does multiple reset operations. It resets the coordinate system back to "WORLD", removes any transformation information, removes the internal cache used to speed up the coordinated motion moves, clears all the status flags from motors, and removes any appended paths as a result of AppendPaths command. Reset command should be used only once at the beginning of the program. The MMP program template used to create a new MMP program automatically includes call to Reset command in its initialization method.

**Example** Following is an example of resetting the SLA Operating Software.

```
sla.Reset()
```

Group [SLA Initialization Commands](#)

## 25. ReversePath

**Summary** Reverse the indicated axis values.

**Declaration** ReversePath(Optional xReverse As Boolean, Optional yReverse As Boolean, Optional zReverse As Boolean)

**Return** No return value.

**Description** ReversePath command reverses the order of values in the indicated coordinate for a path. By default the command will reverse all the three coordinates, effectively reversing the path (the last point of the path becomes the first point and vice versa). If only a specific coordinate needs to be reversed, pass False to other coordinates. This along with [ReflectAxis](#) can be used to create a continuous path combining the original and the reflected path. This command differs from other transformation command since it specifically applies only to a path and can not be chained. A transformation has to be explicitly applied to the position data using one of the ApplyTransformation\* command to have any effect on the motion.

**Example** Following examples show how to reverse a whole path or a specific coordinate. The first example reverses the whole path and the second example reverses only the x coordinates of the points in a path.

```
sla.ReversePath()  
  
sla.ReversePath( , False, False)
```

Group [SLA Axis Transformation Commands](#)

## 26. RotateAxis

**Summary** Rotate around specified axis by given angle (degrees).

**Declaration** RotateAxis (Optional angle As Double, Optional aroundAxis As Integer, Optional isChained As Boolean)

**Return** No return value.

**Description** RotateAxis command rotates a point in orthogonal plane around the specified axis (1 - default, 2 or 3) in the WORLD coordinate system to create transformed values in the USER coordinate system. Using the optional isChained argument (False by default), the rotate transformation can be chained with any earlier defined transformation to create a more complex combined transformation. A transformation has to be explicitly applied to the position data using one of the ApplyTransformation\* command to have any effect on the motion. It is useful to note that the same effect can be achieved by using [RotateAxisAroundPoint](#) command with origin as aroundPoint parameter.

**Example** Following example shows how to rotate a point in x-y plane by 90 degrees and remove any of the earlier transformations by specifying isChained as False.

```
sla.RotateAxis(90, 3, False)
```

Group [SLA Axis Transformation Commands](#)

## 27. RotateAxisAroundPoint

**Summary** Rotate around specified point by given angle (degrees).

**Declaration** RotateAxisAroundPoint(Optional aroundPoint As Point, Optional angle As Double, Optional aroundAxis As Integer, Optional isChained As Boolean)

**Return** No return value.

**Description** RotateAxisAroundPoint command rotates a point in orthogonal plane around the axis that passes through the specified point and is parallel to the aroundAxis (1 - default, 2 or 3) in the WORLD coordinate system to create transformed values in the USER coordinate system. Using the optional isChained argument (False by default), the rotate transformation can be chained with any earlier defined transformation to create a more complex combined transformation. A transformation has to be explicitly applied to the position data using one of the ApplyTransformation\* command to have any effect on the motion.

**Example** Following example shows how to rotate a point in x-y plane around MyDataset.point1 by 90 degrees and remove any of the earlier transformations by specifying isChained as False.

```
sla.RotateAxisAroundPoint(MyDataset.point1, 90,
3, False)
```

Group [SLA Axis Transformation Commands](#)

## 28. RunDiagnostics

**Summary** Run diagnostics to recover from unexpected motor problems.

**Declaration** RunDiagnostics()

**Return** Returns True or False depending on the success or failure of the command.

**Description** RunDiagnostics runs several internal diagnostics to fix a problem which can't be fixed by user level commands. For example, when power is turned off and on again (e.g. in the event of an E-Stop) while the SLA OS program is running, the serial connection becomes invalid. In this case no communication can take place between the software and the motors. Running this command reconnects to the motors again with the new connections and allowing the communication to take place.

**Example** Following is an example of running diagnostics to fix unexpected problems.

```
sla.RunDiagnostics()
```

Group [SLA Motor Commands](#)

## 29. SaveValue

**Summary** Save a state in memory or persistent storage for later retrieval.

**Declaration** SaveValue(key As String, value As String, Optional isPersistence As Boolean)

**Return** No return value.

**Description** SaveValue command stores a String value in program memory or optionally on the disk when isPersistence is declared True (False by default). When a value is stored in memory, it is not available when the SLA Operating Software exits e.g. in case of power failure. If there is some critical information that needs to survive the unexpected exit of the SLA Operating Software, it must be stored with isPersistence flag to be True. Since all programs share the same memory space, it is important to choose the name of keys judiciously to avoid overwriting. Another very important usage is as a shared memory space for communicating among different programs when [Multitasking](#) feature is used. A program running in one thread can SaveValue, which can be retrieved by another program running in different thread using [GetValue](#). Since both key and value arguments are passed as String, any numerical value must be converted to String using CStr() function.

**Example** Following is an example of storing a Integer value using "result" as the key.

```
Dim value as Integer  
value = 10  
sla.SaveValue("result", CStr(value))
```

Group [SLA State Management Commands](#)

## 30. ScaleAxis

**Summary** Scale axis by specified scaleFactor.

**Declaration** ScaleAxis(Optional xScale As Double, Optional yScale As Double, Optional zScale As Double, Optional isChained As Boolean)

**Return** No return value.

**Description** ScaleAxis command multiplies the scaleFactor (either negative or positive) specified by xScale, yScale and zScale to the x, y or z axis values in the WORLD coordinate system to create transformed values in the USER coordinate system. Since each of the scaleFactor is optional, it is possible to perform scaling only in the desired coordinate. Using the optional isChained argument (False by default), the scale transformation can be chained with any earlier defined transformation to create a more complex combined transformation. A transformation has to be explicitly applied to the position data using one of the ApplyTransformation\* command to have any effect on the motion.

**Example** Following example shows how to multiply x and z axis values by 2 and remove any of the earlier transformations by specifying isChained as False.

```
sla.ScaleAxis(2, ,2, False)
```

Group [SLA Axis Transformation Commands](#)

## 31. SendMail

**Summary** Send email to the specified address.

**Declaration** SendMail(smtpServer As String, recipient As String, message As String)

**Return** No return value.

**Description** SendMail command sends an email containing the message to the specified recipient using the smtpServer for relay. The sender will be sla@robohandsla.com (SLA Software).

**Example** Following is an example of sending email to Quality Assurance department of an example company.

```
sla.SendMail("smtp.exampleCompany.com",
"qa@exampleCompany.com", "SLA Operating Software completed
successfully!")
```

Group [SLA Miscellaneous Commands](#)

## 32. SetServoOff

**Summary** Turn off servo in the motor, optionally turning off the automatic brakes.

**Declaration** SetServoOff (motorIndex As Integer, Optional autoBrake As Boolean)

**Return** No return value.

**Description** SetServoOff command turns off servo in the indicated motor (1, 2 or 3). If there is a need for moving motors around by hand, the automatic brakes (on by default) can be turned off by supplying the optional argument autoBrake as False. Since turning the servo off and the brakes at the same time can lead to undesired motions (e.g. z slide falling down due to gravity), exercise caution in using the command.

**Example** Following examples turns off servo of motorX, while maintaining the brakes.

```
sla.SetServoOff(1, True)
```

Group [SLA Motor Commands](#)

### 33. SetSwitch

**Summary** Set the outputSwitch to specified status.

**Declaration** SetSwitch (motorIndex As Integer, outputSwitch As String, status As Integer)

**Return** No return value.

**Description** SetSwitch command sets outputSwitch on the indicated IO unit to specified status. The motorIndex parameter could be any of the motors (1, 2 or 3) or external IO indicated by 0. The outputSwitch names can be defined on the configuration screen. The status could be 0 (for setting outputSwitch to low/off) or 1 (for setting outputSwitch to high/on).

**Example** Following examples show how to set the output switch status for different devices. In the first example the command sets the value of "MotorX\_Output\_Switch" located on motorX to 1. In the second example the command sets the value of "External\_IO\_Output\_Switch" located on external IO unit (optional) to 0.

```
sla.SetSwitch (1, "MotorX_Output_Switch", 1)
sla.SetSwitch (0, "External_IO_Output_Switch", 0)
```

Group [SLA I/O Commands](#)

### 34. ShiftAxis

**Summary** Shift axis by specified distances.

**Declaration** ShiftAxis(Optional xShift As Double , Optional yShift As Double, Optional zShift As Double, Optional isChained As Boolean)

**Return** No return value.

**Description** ShiftAxis command adds the shiftDistance (either negative or positive) specified by xShift, yShift and zShift to the x, y or z axis values in the WORLD coordinate system to create transformed values in the USER coordinate system. Since each of the shiftDistance is optional, it is possible to perform shifts only in the desired coordinate. Using the optional isChained argument (False by default), the shift transformation can be chained with any earlier defined transformation

to create a more complex combined transformation. A transformation has to be explicitly applied to the position data using one of the `ApplyTransformation*` command to have any effect on the motion.

**Example** Following example shows how to shift y axis values by 20 units and remove any of the earlier transformations by specifying `isChained` as `False`.

```
sla.ShiftAxis( , 20, , False)
```

Group [SLA Axis Transformation Commands](#)

## 35. StartProgram

**Summary** Start another program in a different thread.

**Declaration** `StartProgram(programName As String)`

**Return** No return value.

**Description** `StartProgram` command spawns the specified program in a new thread and begins its execution. Since this is a non-blocking command, the original program continues to run at the same time. Once started, both the programs run independent of each other i.e. no parent-child relationship is maintained. These programs can communicate among themselves using the shared memory provided by [SLA State Management Commands](#). Running multiple programs simultaneously provides a very powerful multi-tasking capability to SLA Operating Software. However, since these threads are sharing the same CPU, the available cycle time gets divided among them which may result in slowing down of individual programs. In the time sensitive operations, it is recommended to run only one program at a time. Also make sure that only one of the concurrently running program contains the motion related commands, as otherwise it can result in an unpredictable behavior. Note that it is an idempotent command i.e. multiple invocations for starting the same program will result in only one instance of the program starting and all subsequent requests will be ignored. Typical application includes running the motors in one program while monitoring inputs or controlling outputs in another program.

**Example** Following example starts another program "program2.mmp".

```
sla.StartProgram("program2.mmp")
```

Group [SLA Multi Tasking Commands](#)

## 36. StartTimer

**Summary** Start the specified timer.

**Declaration** `StartTimer(timerKey As String)`

**Return** No return value.

**Description** `StartTimer` command starts a timer with the specified `timerKey`. Multiple timers can be started by specifying different `timerKeys`. The command [ElapsedTimer](#) is used to retrieve the current value of the timer using the `timerKey`.

**Example** Following example starts the myTimer.

```
sla.StartTimer("myTimer")
```

Group [SLA Instrumentation Commands](#)

## 37. StopMotion

**Summary** Stop motion of the specified motor.

**Declaration** StopMotion(Optional motorIndex As Integer, Optional deaccelerate As Boolean)

**Return** No return value.

**Description** StopMotion command terminates the current trajectory of the specified motor. The motorIndex parameter could be any of the motors (1, 2 or 3). If no argument is specified, all motors (default) are stopped. The second optional parameter deaccelerate (True by default), controls the velocity profile while stopping the motors. If True then the motors deaccelerate to stop, otherwise they stop immediately. If the command StopMotion is used with the coordinated motion commands [DoLine](#) or [DoPath](#) from a different thread, it can result in an error.

**Example** Following example deaccelerates motorX to stop.

```
sla.StopMotion(1, True)
```

Group [SLA Motion Commands](#)

## 38. StopProgram

**Summary** Stop another program running in the different thread.

**Declaration** StopProgram(programName As String)

**Return** No return value.

**Description** StopProgram command terminates the specified program running in the different thread. Since all the programs run independent of each other i.e. no parent-child relationship is maintained, stopping of a parent program has no effect on child program or vice versa. The program terminates after completing the currently executing statement.

**Example** Following example stops another program "program2.mmp".

```
sla.StopProgram("program2.mmp")
```

Group [SLA Multi Tasking Commands](#)

## 39. WaitForStop

**Summary** Wait for the motion to be completed.

**Declaration** WaitForStop(Optional motorIndex As Integer, Optional monitorMotorIndex As Integer, Optional monitorInputSwitch As String, Optional monitorInputSwitchStatus As Integer, Optional decelerate As Boolean, Optional timeOutSeconds As Long)

**Return** Returns True if all motors did stop or False otherwise (including return due to timeOut)

**Description** WaitForStop command waits for the end of motion of all (default) motors. If the optional motorIndex argument is specified then it waits for the end of motion only for that motor. The motorIndex parameter could be any of the motors (1, 2 or 3). The subsequent three optional arguments can be used together to provide a monitor signal which when activated (has the value specified by monitorInputSwitchStatus) stops the motion. The values for monitorMotorIndex are the same as that for [CheckSwitch](#) command (1,2,3 for IO's on motors or 0 for external IO). monitorInputSwitch is the name of the input switch to monitor and monitorInputSwitchStatus indicates on what status (0 or 1) the motion stops. The optional parameter decelerate (True by default), controls the velocity profile while stopping the motor. If True then the motor decelerates to stop, otherwise it stops immediately. The optional parameter timeOutSeconds allows it to wait only for specified seconds. If the motors are still in motion after timeOutSeconds, command will return with the False return value. If a motor stops due to fault (e.g. position error or limit switch), then an error condition is raised which will usually end the program. This command blocks the program execution till either the motion stops (if no monitor related or timeOut arguments are specified) or when the monitor signal is activated (if monitor related arguments are specified) or when the timeOut period is expired. This command can be used along with [DoRelativeMove](#), [DoPositionMove](#) or [DoVelocityMove](#) commands to achieve synchronized motion (as opposed to coordinated motion where each of the motors move in lockstep manner) where each motor runs independently to obtain highly optimized timing profile.

**Example** Following examples demonstrate the command with and without the external signal monitoring. The first example shows starting synchronized motion by using DoRelativeMove and waiting for completion of motion of all motors with timeOut parameter of 5 seconds. MotorX is doing relative move from the current location for 100 units with speed 100 and acceleration 1000. MotorY is doing relative move from the current location for 200 units with speed 200 and acceleration 1000. MotorX is doing relative move from the current location for 500 units with speed 500 and acceleration 1000. The use of WaitForStop ensures that the subsequent commands will execute after all motors have reached their destinations or five seconds have elapsed, whichever occurs first. The second example shows starting synchronized motion by using DoPositionMove and blocking till the "MotorX\_Input\_Switch" switch located on motorX goes high (1) or the motion is completed on all motors. If the "MotorX\_Input\_Switch" is activated before the motion ends, the motor will come to abrupt and immediate stop, since the parameter decelerate is False.

```
sla.DoRelativeMove 1, 100, 100, 1000
```

```
sla.DoRelativeMove 2, 200, 200, 1000
```

```
sla.DoRelativeMove 3, 500, 500, 1000
```

```
sla.WaitForStop(, , , , 5)
```

```
sla.DoPositionMove 1, 100, 100, 1000
```

```
sla.DoPositionMove 2, 200, 200, 1000
```

```
sla.DoPositionMove 3, 500, 500, 1000
```

```
sla.WaitForStop(0, 1, "MotorX_Input_Switch", 1,  
False)
```

Group [SLA Motion Commands](#)

## 40. WaitForSwitch

**Summary** Wait for an input switch to attain specified status.

**Declaration** WaitForSwitch (motorIndex As Integer, inputSwitch As String, status As Integer, Optional timeOutSeconds As Long)

**Return** Returns True or False depending on the success or failure of the command.

**Description** WaitForSwitch command waits timeOutSeconds for an input switch to attain the specified status on the indicated IO unit. The motorIndex parameter could be any of the motors (1, 2 or 3) or external IO indicated by 0. The inputSwitch names can be defined on the configuration screen. The status could be 0 (for inputSwitch going low/off) or 1 (for inputSwitch going high/on). If timeOutSeconds is not specified or is negative value, the program will wait indefinitely (default).

**Example** Following examples show how to wait for the input switch status for different devices. In the first example the command waits at most 10 seconds for "MotorX\_Input\_Switch" located on motorX to go high. In the second example the command waits indefinitely for "External\_IO\_Input\_Switch" located on external IO unit (optional) to go low.

```
sla.WaitForSwitch(1, "MotorX_Input_Switch", 1,  
10)  
  
sla.WaitForSwitch(0, "External_IO_Input_Switch",  
0)
```

Group [SLA I/O Commands](#)

## EXCEL Commands Reference

Following are the EXCEL Commands which can be used in a Multi Motor Program (MMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access. All the EXCEL commands can be used in a MMP program by using "excel." namespace (type CTRL-SPACE after typing excel. in the MMP Programming environment.)

---

### EXCEL Commands in Related Groups

The EXCEL Commands are categorized in each group depending on their functionalities.

- **EXCEL Initialization Commands**

This command is used to initialize internal Excel cache.

- [ReadFile](#)

- **EXCEL Interaction Commands**

This command is used to read the values from the internal Excel cache.

- [GetValue](#)
- 

### EXCEL Commands in Alphabetic Order

1. [GetValue](#)
  2. [ReadFile](#)
- 

### EXCEL Commands

#### 1. ReadFile

**Summary** Read from the Excel file.

**Declaration** ReadFile(fileName As String, Optional sheetName As String)

**Return** Returns True or False depending on the success or failure of the command.

**Description** ReadFile command read from the specified Excel file and optionally specified sheet (default is 'Sheet1'). If read attempt fails (e.g. file is not present), it returns False

**Example** Following is an example of reading from C:\Data.xls file's 'Main' sheet.

```
Dim result as Boolean  
result = excel.ReadFile("C:\Data.xls", "Main")
```

Group [EXCEL Initialization Commands](#)

## 2. GetValue

**Summary** Get the value from Excel spreadsheet.

**Declaration** GetValue(row As Integer, col As String)

**Return** Returns a string value.

**Description** GetValue command gets the value of row and column location from the earlier read Excel spreadsheet. The column argument can be specified as either number or column letter. All values are returned as string which can be converted to the appropriate type..

**Example** Following is an example of reading a value for row 2, column A and assigning it to result Integer variable. Note that the same value can be obtained by using column number 1.

```
Dim result as Integer  
result = CInt(excel.GetValue(2,"A"))  
result = CInt(excel.GetValue(2,"1")) 'same value
```

Group [EXCEL Interaction Commands](#)

## VISION Commands Reference

Following are the VISION Commands which can be used in a Multi Motor Program (MMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access. All the VISION commands can be used in a MMP program by using "vision." namespace (type CTRL-SPACE after typing vision. in the MMP Programming environment.)

---

### VISION Commands in Related Groups

The VISION Commands are categorized in each group depending on their functionalities.

- **VISION Connection Commands**

These commands are used to establish connection to vision system.

- [ConnectCognex](#)
- [ConnectDVT](#)

- **VISION Interaction Commands**

These commands are used to interact with the vision system.

- [GetCognexValue](#)
  - [GetDVTValue](#)
  - [ProcessCognex](#)
  - [ProcessDVT](#)
- 

### VISION Commands in Alphabetic Order

1. [ConnectCognex](#)
  2. [ConnectDVT](#)
  3. [GetCognexValue](#)
  4. [GetDVTValue](#)
  5. [ProcessCognex](#)
  6. [ProcessDVT](#)
- 

### VISION Commands

#### 1. **ConnectCognex**

**Summary** Connect to the Cognex vision system.

**Declaration** ConnectCognex(host As String, port as Integer, Optional user As String, Optional password As String)

**Return** Returns True or False depending on the success or failure of the command.

**Description** Connect command establishes connection to the Cognex vision system on host and port with optional user and password. If connection fails (e.g. user or password is wrong), it returns False

**Example** Following is an example of connecting to Cognex vision system on host 'localhost', port 23 and user and password as 'admin'.

```
Dim result as Boolean
result =
vision.ConnectCognex("localhost",23,"admin","admin")
```

Group [VISION Connection Commands](#)

## 2. ConnectDVT

**Summary** Connect to the DVT vision system.

**Declaration** ConnectDVT(host As String, port as Integer, Optional user As String, Optional password As String)

**Return** Returns True or False depending on the success or failure of the command.

**Description** Connect command establishes connection to the DVT vision system on host and port with optional user and password. If connection fails (e.g. user or password is wrong), it returns False

**Example** Following is an example of connecting to DVT vision system on host 'localhost', port 5000.

```
Dim result as Boolean
result = vision.ConnectDVT("localhost",5000)
```

Group [VISION Connection Commands](#)

## 3. GetCognexValue

**Summary** Read the value from Cognex Vision System.

**Declaration** GetCognexValue(col As String, row As Integer)

**Return** Returns a string value.

**Description** GetCognexValue command reads the value from col and row location on Cognex system spreadsheet. In Cognex system, each column is alphabetically named (a, b, c etc.) and each row is numerically numbered (1, 2, 3 etc.). All values are returned as text.

**Example** Following is an example of reading a value for spreadsheet location a, 2 and assigning it to result Integer variable.

```
Dim result as Integer
result = CInt(vision.GetCognexValue("a",2))
```

Group [VISION Interaction Commands](#)

#### 4. GetDVTValue

**Summary** Read the value from DVT Vision System.

**Declaration** GetDVTValue(key As String)

**Return** Returns a string value.

**Description** GetDVTValue command returns the value represented by key as string.

**Example** Following is an example of reading a value associated with key 'radius' and assigning it to result Integer variable.

```
Dim result as Integer
result = CInt(vision.GetDVTValue("radius"))
```

Group [VISION Interaction Commands](#)

#### 5. ProcessCognex

**Summary** Process the image capture.

**Declaration** ProcessCognex()

**Return** Returns True or False depending on the success or failure of the command.

**Description** Process command triggers the image capture and subsequent processing of the acquired image.

**Example** Following is an example of processing once the part is in place.

```
vision.ProcessCognex()
```

Group [VISION Interaction Commands](#)

#### 6. ProcessDVT

**Summary** Process the image capture.

**Declaration** ProcessDVT()

**Return** Returns True or False depending on the success or failure of the command.

**Description** ProcessDVT command triggers the image capture and subsequent processing of the acquired image.

**Example** Following is an example of processing once the part is in place.

```
vision.ProcessDVT()
```

**Group** [VISION Interaction Commands](#)

## HMI Commands Reference

Following are the HMI Commands which can be used in a Multi Motor Program (MMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access. All the HMI commands can be used in a MMP program by using "hmi." namespace (type CTRL-SPACE after typing hmi. in the MMP Programming environment.)

---

### HMI Commands in Related Groups

The HMI Commands are categorized in each group depending on their functionalities.

- **HMI Data Commands**

These commands are used to control the I/O switches. They can be used to control the integrated I/O as well as externally supplied unit.

- [ReadBinary](#)
- [ReadRegister](#)
- [SaveIO](#)
- [WriteBinary](#)
- [WriteRegister](#)

- **HMI Motion Commands**

These commands directly related to individual motors that drive the slides. They can be used to obtain useful status information regarding motors.

- [WaitForStop](#)
- 

### HMI Commands in Alphabetic Order

1. [ReadBinary](#)
  2. [ReadRegister](#)
  3. [SaveIO](#)
  4. [WaitForStop](#)
  5. [WriteBinary](#)
  6. [WriteRegister](#)
-

## HMI Commands

### 1. ReadBinary

**Summary** Read a binary number from the HMI unit.

**Declaration** ReadBinary(ioNumber As Integer)

**Return** Returns a binary Integer value.

**Description** ReadBinary command reads a binary (0 or 1) value from the Master HMI unit for the specified ioNumber.

**Example** Following is an example for reading a binary value for ioNumber 3 and assigning it to ioValue Integer variable.

```
Dim ioValue as Integer
ioValue = hmi.ReadBinary(3)
```

Group [HMI Data Commands](#)

### 2. ReadRegister

**Summary** Read an unsigned 16 bit integer from the HMI unit.

**Declaration** ReadRegister(ioNumber As Integer)

**Return** Returns a integer Long value.

**Description** ReadRegister command reads an unsigned 16 bit integer (0 to 65535) value from the Master HMI unit for the specified ioNumber.

**Example** Following is an example for reading a value for ioNumber 3 and assigning it to ioValue Long variable.

```
Dim ioValue as Long
ioValue = hmi.ReadRegister(3)
```

Group [HMI Data Commands](#)

### 3. SaveIO

**Summary** Save Modbus IO data to the persistent storage.

**Declaration** SaveIO()

**Return** No return value.

**Description** SaveIO command writes the current values of Modbus registers and coils to the persistent storage. These values are restored when the program starts again.

**Example** Following is an example for saving the Modbus IO data.

```
hmi.SaveIO()
```

Group [HMI Data Commands](#)

## 4. WaitForStop

**Summary** Wait for the motion to be completed.

**Declaration** WaitForStop(Optional motorIndex As Integer, Optional monitorIONumber As Integer, Optional monitorIOStatus As Integer, Optional deaccelerate As Boolean)

**Return** No return value.

**Description** WaitForStop command waits for the end of motion of all motors (default). If the optional motorIndex argument is specified then it waits for the end of motion only for that motor. The motorIndex parameter could be any of the motors (1, 2 or 3). The additional two optional arguments can be used together to provide a monitor signal which when activated (has the value specified by monitorIOStatus) stops the motion. The value for monitorIONumber is any binary ioNumber on the HMI unit. monitorInputSwitchStatus indicates on what status (0 or 1) the motion stops. The optional parameter deaccelerate (True by default), controls the velocity profile while stopping the motor. If True then the motor deaccelerates to stop, otherwise it stops immediately. This command blocks the program execution till either the motion stops (if no monitor related arguments are specified) or when the monitor signal is activated (if monitor related arguments are specified). This command can be used along with [sla.DoRelativeMove](#), [sla.DoPositionMove](#) or [sla.DoVelocityMove](#) commands to achieve synchronized motion (as opposed to coordinated motion where each of the motors move in lockstep manner) where each motor runs independently to obtain highly optimized timing profile.

**Example** Following example shows starting synchronized motion by using [sla.DoPositionMove](#) and blocking till the signal at ioNumber 5 goes low (0) or the motion is completed on all motors. If the IO 5 is activated before the motion ends, the motors will come to abrupt and immediate stop, since the parameter deaccelerate is False.

```
sla.DoPositionMove 1, 100, 100, 1000
sla.DoPositionMove 2, 200, 200, 1000
sla.DoPositionMove 3, 500, 500, 1000
hmi.WaitForStop(0, 5, 0, False)
```

Group [HMI Motion Commands](#)

## 5. WriteBinary

**Summary** Write a binary number to the HMI unit.

**Declaration** WriteBinary(ioNumber As Integer, value As Integer)

**Return** No return value.

**Description** WriteBinary command writes a binary (0 or 1) value to the Master HMI unit for the specified ioNumber.

**Example** Following is an example for writing a binary value 1 to ioNumber 3.

```
hmi.WriteBinary(3, 1)
```

**Group** [HMI Data Commands](#)

## 6. WriteRegister

**Summary** Write an unsigned 16 bit integer to the HMI unit.

**Declaration** WriteRegister(ioNumber As Integer, value As Long)

**Return** No return value.

**Description** WriteRegister command writes an unsigned 16 bit integer (0 to 65535) value to the Master HMI unit for the specified ioNumber.

**Example** Following is an example for writing an integer value 314 to ioNumber 3.

```
hmi.WriteRegister(3, 314)
```

**Group** [HMI Data Commands](#)

## SERIAL Commands Reference

Following are the SERIAL Commands which can be used in a Multi Motor Program (MMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access. All the SERIAL commands can be used in a MMP program by using "serial." namespace (type CTRL-SPACE after typing serial. in the MMP Programming environment.)

---

### SERIAL Commands in Related Groups

The SERIAL Commands are categorized in each group depending on their functionalities.

- **SERIAL Connection Commands**

These commands are used to open and close a connection to the serial system.

- [ClosePort](#)
- [OpenPort](#)

- **SERIAL Interaction Commands**

These commands are used to interact with the serial system.

- [ReadPort](#)
  - [WritePort](#)
- 

### SERIAL Commands in Alphabetic Order

1. [ClosePort](#)
  2. [OpenPort](#)
  3. [ReadPort](#)
  4. [WritePort](#)
- 

### SERIAL Commands

#### 1. **ClosePort**

**Summary** Close previously opened serial port.

**Declaration** ClosePort()

**Return** No return value.

**Description** ClosePort command closes previously opened serial port. If the port is not open, this command has no effect.

**Example** Following is an example of closing an already opened serial port.

```
serial.ClosePort()
```

Group [SERIAL Connection Commands](#)

## 2. OpenPort

**Summary** Open specified port to the serial system.

**Declaration** OpenPort(portNum As Integer, Optional baudRate As Long, Optional parity As String, Optional dataBits As Integer, Optional stopBit As Double, Optional handshake As Integer)

**Return** No return value.

**Description** OpenPort command establishes connection to the serial system at the specified portNum (1 = COM1, 2 = COM2 etc.). The additional optional parameters can be specified to further control the communication. Valid and default values are shown below.

- baudRate - 110, 300, 600, 1200, 2400, 9600 (default), 14400, 19200, 28800, 38400, 56000, 128000, 256000
- parity - "E", "M", "N" (default), "O", "S"
- dataBits - 4, 5, 6, 7, 8 (default)
- stopBit - 1 (default), 1.5, 2
- handshake - 0 (none), 1 (XON/XOFF, default), 2 (RTS/CTS), 3 (both)

**Example** Following is an example of opening COM1 port with 19200 baudrate and using other default values.

```
serial.OpenPort 1, 19200
```

Group [SERIAL Connection Commands](#)

## 3. ReadPort

**Summary** Read from the previously opened serial port.

**Declaration** ReadPort()

**Return** Returns a string value.

**Description** ReadPort command reads from the previously opened port and returns a string value.

**Example** Following is an example of reading the serial port.

```
Dim response as String  
response = serial.ReadPort()
```

Group [SERIAL Interaction Commands](#)

## 4. WritePort

**Summary** Write to the previously opened serial port.

**Declaration** WritePort(data As String)

**Return** No return value.

**Description** WritePort command writes data to the previously opened port.

**Example** Following is an example of writing to the serial port.

```
serial.WritePort("ORSP")
```

**Group** [SERIAL Interaction Commands](#)

## SLA SMP Commands Reference

Following are the SMP Commands which can be used in a Smart Motor Program (SMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access.

---

### SMP Commands in Related Groups

The SMP Commands are categorized in each group depending on their functionalities.

- **SMP Status Commands**

These commands can be used to obtain the binary status bits (B\*) to use in a program or for reporting as the host commands (RB\*).

- [ADDR](#)
- [Ba](#)
- [Bb](#)
- [Bc](#)
- [Bd](#)
- [Be](#)
- [Bf](#)
- [Bh](#)
- [Bi](#)
- [Bk](#)
- [Bl](#)
- [Bm](#)
- [Bo](#)
- [Bp](#)
- [Br](#)
- [Bs](#)
- [Bt](#)
- [Bu](#)
- [Bv](#)
- [Bw](#)
- [Bx](#)
- [RBa](#)
- [RBb](#)
- [RBc](#)
- [RBd](#)
- [RBe](#)
- [RBf](#)
- [RBh](#)
- [RBi](#)
- [RBk](#)
- [RBl](#)
- [RBm](#)
- [RBo](#)
- [RBp](#)
- [RBr](#)
- [RBS](#)

- [RBt](#)
- [RBU](#)
- [RBw](#)
- [RBx](#)
- [RPW](#)
- [RS](#)
- [RW](#)

- **SMP IO Commands**

These commands are used to control the integrated I/O (12 input and 6 output) switches.

- [I1 to I12](#)
- [O1 to O6](#)

- **SMP Brake Commands (where optional brake exists)**

Many SmartMotors are available with power safe brakes. These brakes will apply a force to keep the shaft from rotating should the SmartMotor lose power. The brakes used in SmartMotors are zero-backlash devices with extremely long life spans. It is well within their capabilities to operate interactively within an application. Care should be taken not to create a situation where the brake will be set repeatedly during motion. That will reduce the brake's life

- [BRKENG](#)
- [BRKRLS](#)
- [BRKSRV](#)
- [BRKTRJ](#)

- **SMP Tuning Commands**

These (K\*) commands help tune a SmartMotor.

- [F](#)
- [KA=expression](#)
- [KD=expression](#)
- [KG=expression](#)
- [KI=expression](#)
- [KL=expression](#)
- [KP=expression](#)
- [KS=expression](#)
- [KV=expression](#)

- **SMP Reset Commands**

These commands help to reset system state flags.

- [Z](#)
- [Za](#)
- [Zb](#)
- [Zc](#)
- [Zd](#)
- [Zf](#)
- [Zl](#)
- [Zr](#)
- [Zs](#)
- [Zu](#)
- [Zw](#)
- [ZS](#)

- **SMP Programming Commands**

Program commands are like chores, whether it is to turn on an output, set a velocity or start a move. A program is a list of these chores. When a programmed SmartMotor is powered-up or its program is reset with the Z command, it will execute its program from top to bottom, with or without a host P.C. Connected. This section covers the commands that control the program itself. Once the program is running, there are a variety of commands that can redirect program flow and most of those can do so based on certain conditions. How these conditional decisions are setup determines what the programmed SmartMotor will do, and exactly how "smart" it will actually be.

- [BREAK](#)
- [C#](#)
- [CASE](#)
- [DEFAULT](#)
- [ELSE](#)
- [ELSEIF](#)
- [END](#)
- [ENDS](#)
- [ENDIF](#)
- [GOSUB#](#)
- [GOTO#](#)
- [IF](#)
- [LOOP](#)
- [RETURN](#)
- [RUN](#)
- [RUN?](#)
- [SWITCH](#)
- [TWAIT](#)
- [WAIT](#)
- [WHILE](#)

## • SMP Motion Commands

These commands are responsible for the motion of a SmartMotor in various modes.

- [A](#)
- [D](#)
- [G](#)
- [MP](#)
- [MV](#)
- [P](#)
- [RA](#)
- [RD](#)
- [RP](#)
- [RV](#)
- [S](#)
- [V](#)
- [X](#)

## • SMP Variables Commands

Variables are data holders that can be read, set and changed within the program or over the communication channel.

A variable can be set to an expression with only one operator and two operands. The operators can be any of the following:

+ Addition  
 - Subtraction  
 \* Multiplication  
 / Division  
 & Bit wise AND  
 | Bit wise OR

The following are legal:

$a=b+c$ ,  $a=b+3$ ,  $a=5+8$   
 $a=b-c$ ,  $a=5-c$ ,  $a=b-10$   
 $a=b*c$ ,  $a=3*5$ ,  $a=c*3$   
 $a=b/c$ ,  $a=b/2$ ,  $a=5/b$   
 $a=b\&c$ ,  $a=b\&8$   
 $a=b|c$ ,  $a=b|15$

An array variable is one that has a numeric index component that allows the numeric selection of which variable a program is to access. Common use of the array variable type is to set up what is called a buffer. In many applications, the SmartMotor will be tasked with inputting data about an array of objects and to do processing on that data in the same order, but not necessarily at the same time. Under those circumstances it may be necessary to "buffer" or "store" that data while the SmartMotor processes it at the proper times.

To set up a buffer the programmer would allocate a block of memory to it, assign a variable to an input pointer and another to an output pointer. Both pointers would start out as zero and every time data was put into the buffer the input pointer would increment. Every time the data was used, the output buffer would likewise increment. Every time one of the pointers is incremented, it would be checked for exceeding the allocated memory space and rolled back to zero in that event, where it would continue to increment as data came in. This is a first-in, first-out or "FIFO" circular

buffer. Be sure there is enough memory allocated so that the input pointer never overruns the output pointer.

In addition there is 32K of non-volatile EEPROM memory to store variables when they need to survive the motor powering down which can be accessed using EPTR, VST and VLD commands.

- [@P](#)
- [@PE](#)
- [@V](#)
- [a...z](#)
- [aa...ZZZ](#)
- [al\[index\]](#)
- [aw\[index\]](#)
- [ab\[index\]](#)
- [EPTR=expression](#)
- [Ra ... Rz](#)
- [Raa ... Rzz](#)
- [Raaa ... Rzzz](#)
- [Rab\[index\]](#)
- [Ral\[index\]](#)
- [Raw\[index\]](#)
- [VLD](#)
- [VST](#)

### • SMP Motor Commands

These commands set important characteristics of the SmartMotor.

- [E=expression](#)
- [F=expression](#)
- [I](#)
- [Q](#)
- [OFF](#)
- [RE](#)
- [RI](#)
- [RPE](#)

### • SMP Debug Commands

These commands are used for aiding in debugging the SMP programs.

- [PRINT](#)
  - [SILENT](#)
  - [TALK](#)
-

---

## SMP Commands

[note: *In the command description shown below, # is an Integer number*]

### 1. @P

**Summary** Current position

**Declaration** @P

**Return** Current position in smart motor unit.

**Description** This is actual current position.

**Group** [SMP Status Commands](#)

### 2. @PE

**Summary** Current position error

**Declaration** @PE

**Return** Current position error in smart motor unit.

**Description** This is actual current position error.

**Group** [SMP Status Commands](#)

### 3. @V

**Summary** Current velocity

**Declaration** @V

**Return** Current velocity in smart motor unit.

**Description** This is actual current speed of the motor.

**Group** [SMP Status Commands](#)

### 4. a...z

**Summary** User variables

**Declaration** None

**Return** No return value.

**Description** The first 26 variables are long integers (32 bits) and are accessed with the lower case letters of the alphabet, a, b, c, . . . x, y, z.

a=# Set variable a to a numerical value

a=exp Set variable a to value of an expression

**Group** [SMP Status Commands](#)

### 5. aa...zzz

**Summary** More user variables

**Declaration** None

**Return** No return value.

**Description** In addition to the first 26, there are 52 more long integer variables accessible with double and triple lower case letters: aa, bb, cc, . . . xxx, yyy, zzz. The memory space that holds these 52 variables is more flexible, however. This same variable space can be accessed with an array variable type. This memory space is further made flexible by the fact that it can hold 51 thirty two bit integers, or 101 sixteen bit integers, or 201 eight bit integers (all signed).

**Group** [SMP Status Commands](#)

### 6. al[index]

**Summary** Array variable 32 bit

**Declaration** al[i]=exp

**Return** No return value.

**Description** Set variable to a signed 32 bit value where index i = 0...50. The index i may be a number, a variable a through z, or the sum or difference of any two variables a through z (variables only).

---

Group [SMP Status Commands](#)

## 7. aw[index]

**Summary** Array variable 16 bit

**Declaration** aw[i]=exp

**Return** No return value.

**Description** Set variable to a signed 16 bit value where index  $i = 0...100$ . The index  $i$  may be a number, a variable a thorough z, or the sum or difference of any two variables a thorough z (variables only).

Group [SMP Status Commands](#)

## 8. ab[index]

**Summary** Array variable 8 bit

**Declaration** ab[i]=exp

**Return** No return value.

**Description** Set variable to a signed 8 bit value where index  $i = 0...200$ . The index  $i$  may be a number, a variable a thorough z, or the sum or difference of any two variables a thorough z (variables only).

Group [SMP Status Commands](#)

## 9. A

**Summary** Set absolute acceleration

**Declaration** A=expression

**Return** No return value.

**Description** Acceleration must be a positive integer within the range of 0 to 2,147,483,648. The default is zero forcing something to be entered to get motion. A typical value is 100. If left unchanged, while the motor is moving, this value will not only determine acceleration but also deceleration which will form a triangular or trapezoidal velocity motion profile. This value can be changed at any time. The value set does not get acted upon until the next [G](#) command is sent.

Group [SMP Motion Commands](#)

## 10. ADDR

**Summary** Motor's self address variable

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 11. Ba

**Summary** Over current status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 12. Bb

**Summary** Parity error status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 13. Bc

**Summary** Communication overflow status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 14. Bd

**Summary** Math overflow status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 15. Be

**Summary** Excessive position error status bit

**Declaration**

---

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 16.Bf

**Summary** Communications framing error status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 17.Bh

**Summary** Excessive temperature status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 18.Bi

**Summary** Index captured status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 19.Bk

**Summary** EEPROM data integrity status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 20. BI

**Summary** Historical left limit status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 21. Bm

**Summary** Real time left limit status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 22. Bo

**Summary** Motor off status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 23. Bp

**Summary** Real time right limit status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 24. Br

**Summary** Historical right limit status bit

**Declaration**

**Return** No return value.

---

**Description**

Group [SMP Status Commands](#)

**25. Bs**

**Summary** Syntax error status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**26. Bt**

**Summary** Trajectory in progress status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**27. Bu**

**Summary** Array index error status bit

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**28. Bv**

**Summary** EEPROM locked state (obsolete)

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**29. Bw**

**Summary** Encoder wrap around status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

### 30. Bx

**Summary** Real time index input status bit

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

### 31. BRKENG

**Summary** Brake engage

**Declaration** BRKENG

**Return** No return value.

**Description** Issuing the BRKENG command will engage the brake.

**Group** [SMP Brake Commands](#)

### 32. BRKRLS

**Summary** Brake release

**Declaration** BRKRLS

**Return** No return value.

**Description** Issuing the BRKRLS command will release the brake.

**Group** [SMP Brake Commands](#)

### 33. BRKSRV

**Summary** Release brake when servo active, engage brake when inactive

**Declaration** BRKSRV

**Return** No return value.

**Description** The command BRKSRV engages the brake automatically, should the motor stop servoing and holding position for any reason. This might be due to loss of power or just a position error, limit fault, over-temperature fault.

---

Group [SMP Brake Commands](#)

### 34. BRKTRJ

**Summary** Release brake when running a trajectory, engage under all other conditions. Turns servo off when the brake is engaged.

**Declaration** BRKTRJ

**Return** No return value.

**Description** The command BRKTRJ will engage the brake in response to all of the events described for command BRKSRV, plus any time the motor is not performing a trajectory. In this mode the motor will be off, and the brake will be holding it in position, perfectly still, rather than the motor servoing when it is at rest. As soon as another trajectory is started, the brake will release. The time it takes for the brake to engage and release is on the order of only a few milliseconds.

Group [SMP Brake Commands](#)

### 35. D

**Summary** Set relative distance

**Declaration** D=expression

**Return** No return value.

**Description** The D command allows a relative distance to be specified, instead of an absolute position. The number following is encoder counts and can be positive or negative. The relative distance will be added to the current position, either during or after a move. It is added to the desired position rather than the actual position so as to avoid the accumulation of small errors due to the fact that any servo motor is seldom exactly where it should be at any instant in time.

Group [SMP Motion Commands](#)

### 36. E=expression

**Summary** Set allowable position error

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

### 37. END

**Summary** End program execution

**Declaration** END

**Return** No return value.

**Description** If it's necessary to stop a program, use an END command and execution will stop at that point. An END command can also be sent by the host to intervene and stop a program running within the motor. The SmartMotor program is never erased until a new program is downloaded. To erase the program in a SmartMotor, download only the END command as if it were a new program and that's the only command that will be left on the SmartMotor until a new program is downloaded. To compile properly, every program needs an END somewhere, even if it is never reached. If the program needs to run continuously, the END statement has to be outside the main loop

Group [SMP Programming Commands](#)

### 38. EPTR=expression

**Summary** Set data EEPROM pointer, 0-7999

**Declaration** EPTR=expression

**Return** No return value.

**Description** To read or write into this memory space it is necessary to properly locate the pointer. This is accomplished by setting EPTR equal to the offset.

Group [SMP Status Commands](#)

### 39. F

**Summary** Load filter

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

### 40. F=expression

**Summary** Special functions control

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

### 41. G

**Summary** Start motion (GO)

**Declaration** G

**Return** No return value.

**Description** The G command does more than just start motion. It can be used dynamically during motion to create elaborate profiles. Since the SmartMotor allows position, velocity and acceleration to change during motion, "on-the-fly", the G command can be used to trigger the next profile at any time.

Note: G also resets several system state flags.

Group [SMP Motion Commands](#)

## 42. GOSUB#, RETURN

**Summary** Call a subroutine, Return from subroutine

**Declaration**

**Return** No return value.

**Description** Just like the GOTO# command, the GOSUB# command, in conjunction with a C# label, will redirect program execution to the location of the label. But, unlike the GOTO# command, the C# label needs a RETURN command to return the program execution to the location of the GOSUB# command that initiated the redirection. There may be many sections of a program that need to perform the same basic group of commands. By encapsulating these commands between a C# label and a RETURN, they may be called any time from anywhere with a GOSUB#, rather than being repeated in their totality over and over again. There can be as many as one thousand different subroutines (0 -999) and they can be accessed as many times as the application requires.

By pulling sections of code out of a main loop and encapsulating them into subroutines, the main code can also be easier to read. Organizing code into multiple subroutines is a good practice. The commands that can conditionally direct program flow to different areas use a constant [#] like 1 or 25, a variable like a or a[#] or a function involving constants and/or variables a+b or a/[#]. Only one operator can be used in a function. The following is a list of the operators:

- + Addition
- Subtraction
- \* Multiplication
- /Division
- == Equals (use two =)
- != Not equal
- < Less than
- > Greater than
- <= Less than or equal
- >= Greater than or equal
- & Bit wise AND
- | Bit wise OR

Group [SMP Programming Commands](#)

## 43. GOTO#, C#

**Summary** Redirect program flow, Subroutine label (C0-C999)

**Declaration** GOTO#, C#

**Return** No return value.

**Description** The most basic commands for redirecting program flow, without inherent conditions, are GOTO# in conjunction with C#. Labels are the letter C followed by a number (#) between 0

and 999 and are inserted in the program as place markers. If a label, C1 for example, is placed in a program and that same number is placed at the end of a GOTO command, GOTO1, the program flow will be redirected to label C1 and the program will proceed from there.

As many as a thousand labels can be used in a program (0 -999), but, the more GOTO commands used, the harder the code will be to debug or read. Try using only one and use it to create the infinite loop necessary to keep the program running indefinitely, as some embedded programs do. Put a C1 label near the beginning of the program, but after the initialization code and a GOTO1 at the end and every time the GOTO1 is reached the program will loop back to label C1 and start over from that point until the GOTO1 is reached, again, which will start the process at C1 again, and so on. This will make the program run continuously without ending. Any program can be written with only one GOTO. It might be a little harder, but it will tend to force better program organization, which in turn, will make it easier to be read and changed.

Note: Calling subroutines from the host can crash the stack.

Group [SMP Programming Commands](#)

### 44.1

**Summary** Hardware index position variable

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

### 45.11 to I12

**Summary** Set/Get state of Input switch I1,I2...I12

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

### 46. IF, ELSE, ELSEIF, ENDIF

**Summary** Conditional test

**Declaration** IF expression, If structure element, If structure element, End IF statement

**Return** No return value.

**Description** Once the execution of the code reaches the IF command, the code between that IF and the following ENDIF will execute only when the condition directly following the IF command is true.

```
IF a == 1
```

```
        b = 1
    ENDIF
```

Variable b will only get set to one if variable a is equal to one. If a is not equal to one, then the program will continue to execute using the command following the ENDIF command. Notice also that the SmartMotor language uses a single equal sign (=) to make an assignment, such as where variable a is set to equal the logical state of input A. Alternatively, a double equal (==) is used as a test, to query whether a is equal to 1 without making any change to a. These are two different functions. Having two different syntaxes has farther reaching benefits.

The ELSE and ELSEIF commands can be used to add flexibility to the IF statement. If it were necessary to execute different code for each possible state of variable a, the program could be written as follows:

```
IF a == 0
    b = 1
ELSEIF a == 1
    c = 1
ELSEIF a == 2
    c = 2
ELSE
    d = 1
ENDIF
```

There can be many ELSEIF statements, but at most one ELSE. If the ELSE is used, it needs to be the last statement in the structure before the ENDIF. There can also be IF structures inside IF structures. That's called "nesting" and there is no practical limit to the number of structures that can nest within one another.

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**54. KV=expression**

**Summary** PID velocity feed forward

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**55. MP**

**Summary** Enable position mode

**Declaration** MP

**Return** No return value.

**Description** Position mode is the default mode of operation for the SmartMotor. If the mode were to be changed, the MP command would put it back into position mode. In position mode, the P and D commands will govern motion

Group [SMP Motion Commands](#)

**56. MV**

**Summary** Enable velocity mode

**Declaration** MV

**Return** No return value.

**Description** Velocity mode will allow continuous rotation of the motor shaft. In Velocity mode, the programmed position using the P or the D commands is ignored. Acceleration and velocity need to be specified using the A= and the V= commands. After a G command is issued, the motor will accelerate up to the programmed velocity and continue at that velocity indefinitely. In velocity mode as in Position mode, Velocity and Acceleration are changeable on-the-fly, at any

time. Simply specify new values and enter another G command to trigger the change. In Velocity mode the velocity can be entered as a negative number, unlike in Position mode where the location of the target position determines velocity direction or sign. If the 32 bit register that holds position rolls over in velocity mode it will have no effect on the motion.

Group [SMP Motion Commands](#)

## 57.O

**Summary** Set/Reset origin to any position

**Declaration** O=expression

**Return** No return value.

**Description** The O command (using the letter O, not the number zero) allows the host or program not just to declare the current position zero, but to declare it to be any position, positive or negative. The exact position to be re-declared is the ideal position, not the actual position which may be changing slightly due to hunting or shaft loading. The O= command directly changes the motor's position register and can be used as a tool to avoid +/-31 bit roll over position mode problems. If the SmartMotor runs in one direction for a very long time it will reach position +/- 2,147,483,648 which will cause the position counter to change sign. While that is not an issue with Velocity Mode, it can create problems in position mode

Group [SMP Motor Commands](#)

## 58.O1 to O6

**Summary** Set/Get state of Output switch O1,O2...O6

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 59.OFF

**Summary** Turn motor servo off

**Declaration** OFF

**Return** No return value.

**Description** The OFF command will stop the motor from servoing, much as a position\ error or limit fault would. When the servo is turned off, one of the status LEDs will revert from Green to Red.

Group [SMP Motor Commands](#)

## 60.P

**Summary** Set position

**Declaration** P=expression

**Return** No return value.

**Description** The P command sets an absolute end position. The units are encoder counts and can be positive or negative. The end position can be set or changed at any time during or at the end of previous moves.

Group [SMP Motion Commands](#)

## 61. PRINT

**Summary** Print to RS-232

**Declaration** PRINT()

**Return** No return value.

**Description** A variety of data formats can exist within the parentheses of the PRINT() command. A text string is marked as such by enclosing it between double quotation marks. Variables can be placed between the parentheses as well as two variables separated by one operator. To send out a specific byte value, prefix the value with the # sign and represent the value with as many as three decimal digits ranging from 0 to 255. e.g. it is necessary to send #13 as the last character while using SLA OS software's SMP debug mode. Multiple types of data can be sent in a single PRINT() statement by separating the entries with commas. Do not use spaces outside of text strings because SmartMotors use spaces as delimiters along with carriage returns and line feeds. The following are all valid print statements and will transmit data through the main RS-232 channel:

```
PRINT("Hello world",#13) 'text
PRINT(a*b,#13)           'expression
PRINT(#32,#13)           'data
PRINT("A",a,a*b,#13)    'all
```

Group [SMP Debug Commands](#)

## 62. Ra ... Rz

**Summary** Report variables

**Declaration** Ra ... Rz

**Return** Return long integer (32 bits) value of the variable.

**Description** Report variables a ... z

Group [SMP Status Commands](#)

### 63. Raa ... Rzz

**Summary** Report variables

**Declaration** Raa ... Rzz

**Return** Return long integer (32 bits) value of the variable.

**Description** Report variables aa ... zz

**Group** [SMP Status Commands](#)

### 64. Raaa ... Rzzz

**Summary** Report variables

**Declaration** Raaa ... Rzzz

**Return** Return long integer (32 bits) value of the variable.

**Description** Report variables aaa ... zzz

**Group** [SMP Status Commands](#)

### 65. Rab[index]

**Summary** Report byte array variables (8-bit)

**Declaration** Rab[index]

**Return** Return 8 bit variable value.

**Description** Report 8 bit variable value Rab[i]

**Group** [SMP Status Commands](#)

### 66. Ral[index]

**Summary** Report long array variables (32-bit)

**Declaration** Ral[index]

**Return** Return 32 bit variable value.

**Description** Report 32 bit variable value Ral[i]

**Group** [SMP Status Commands](#)

### 67. Raw[index]

**Summary** Report word array variables (16-bit)

**Declaration** Raw[index]

**Return** Return 16 bit variable value.

---

**Description** Report 16 bit variable value Raw[i]

**Group** [SMP Status Commands](#)

## 68.RA

**Summary** Report acceleration

**Declaration** RA

**Return** Return acceleration in smart motor unit.

**Description** Report buffered acceleration.

**Group** [SMP Status Commands](#)

## 69.RBa

**Summary** Report over current status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 70.RBb

**Summary** Report parity error status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 71.RBc

**Summary** Report communications error status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 72.RBd

**Summary** Report user math overflow status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**73.RBe**

**Summary** Report position error status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**74.RBf**

**Summary** Report communications framing

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**75.RBh**

**Summary** Report overheat status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**76.RBi**

**Summary** Report index status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 77.RBk

**Summary** Report EEPROM read/write status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 78.RBI

**Summary** Report historical left limit status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 79.RBm

**Summary** Report negative limit status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 80.RBo

**Summary** Report motor off status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 81.RBp

**Summary** Report positive limit status

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**82.RBr**

**Summary** Report historical right limit status

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**83.RBs**

**Summary** Report program scan status

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**84.RBt**

**Summary** Report trajectory status

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**85.RBu**

**Summary** Report user array index status

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**86.RBw**

**Summary** Report wrap around status

---

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**87.RBx**

**Summary** Report hardware indexinput level

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**88.RD**

**Summary** Return buffered move distance value

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**89.RE**

**Summary** Report buffered maximum position error

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

**90.RI**

**Summary** Report last stored index position

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 91.RP

**Summary** Report present position

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 92.RPE

**Summary** Report present position error

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 93.RPW

**Summary** Report position and status

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 94.RS

**Summary** Report status byte

**Declaration**

**Return** No return value.

**Description**

**Group** [SMP Status Commands](#)

## 95.RUN

**Summary** Execute stored user program

**Declaration** RUN

**Return** No return value.

---

**Description** If the SmartMotor is reset with a Z command, all previous variables and mode changes will be erased for a fresh start and the program will begin to execute from the top. Alternatively the RUN command can be used to start the program, in which case the state of the motor is unchanged and its program will be invoked.

Group [SMP Programming Commands](#)

## 96. RUN?

**Summary** Halt program if no RUN issued

**Declaration** Run?

**Return** No return value.

**Description** To keep a downloaded program from executing at power-up start the program with the RUN? Command. It will prevent the program from starting when power is applied, but it will not prevent the program from running when the SmartMotor sees a RUN command from a host over the RS-232 port.

Group [SMP Programming Commands](#)

## 97. RV

**Summary** Report velocity

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 98. RW

**Summary** Report status word

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

## 99. S

**Summary** Stop move in progress abruptly

**Declaration** S

**Return** No return value.

**Description** If the S command is issued while a move is in progress it will cause an immediate and abrupt stop with all the force the motor has to offer. After the stop, assuming there is no position error, the motor will still be servoing. The S command works in both Position and Velocity modes.

Group [SMP Motion Commands](#)

## 100. SILENT, TALK

**Summary** Suppress/Enable PRINT() outputs

**Declaration** S

**Return** SILENT, TALK

**Description** SILENT command causes all PRINT() output to be suppressed. This is necessary when host controller is also sending the commands to the SmartMotors as it can interfere with the echo mechanism. To de-assert silent mode, issue TALK command. This is useful for the debugging of SMP programs along with the Motor terminal tab of the SLA OS software. To receive the PRINT statements from the SMP program, select the checkbox at the top of the Motor terminal to receive output in the window.

Group [SMP Debug Commands](#)

## 101. SWITCH, CASE, DEFAULT, BREAK, ENDS

**Summary** Program execution control, Switch-case structure element, Switch-case structure element, Program execution flow control, Program execution control

**Declaration** SWITCH expression, CASE expression, DEFAULT, BREAK, ENDS

**Return** No return value.

**Description** Long, drawn out IF structures can be cumbersome, and burden the program visually. In these instances it can be better to use the SWITCH structure. The following code would accomplish the same thing as the second example program given in the IF command:

```
SWITCH a
  CASE 0
    b=1
    BREAK
  CASE 1
    c=1
    BREAK
  CASE 2
    c=2
```

```

        BREAK
    DEFAULT
        d=1
    BREAK
ENDS

```

Just as a rotary switch directs electricity, the SWITCH structure directs the flow of the program. The BREAK statement then jumps the code execution to the code following the associated ENDS command. The DEFAULT command covers every condition other than those listed. It is optional. Note: The SWITCH statement makes use of the same memory space as variable "zzz". Do not use this variable or array space when using SWITCH.

Group [SMP Programming Commands](#)

## 102. TWAIT

**Summary** Wait during trajectory

**Declaration** TWAIT

**Return** No return value.

**Description** The TWAIT command pauses program execution while the motor is moving. Either the controlled end of a trajectory, or the abrupt end of a trajectory due to an error, will terminate the TWAIT waiting period. If there were a succession of move commands without this command, or similar waiting code between them, the commands would overtake each other because the program advances, even while moves are taking place. The following program has the same effect as the TWAIT command, but has the added virtue of allowing other things to be programmed during the wait, instead of just waiting. Such things would be inserted between the two commands.

```

        WHILE Bt
        LOOP

```

Group [SMP Programming Commands](#)

## 103. V

**Summary** Set maximum permitted velocity

**Declaration** V=expression

**Return** No return value.

**Description** Use the V command to set a limit on the velocity the motor can accelerate to. That limit becomes the slew rate for all trajectory based motion whether in position mode or velocity mode. The value defaults to zero so it must be set before any motion can take place. The new value does not take effect until the next G command is issued.

Group [SMP Motion Commands](#)

**104. VLD**

**Summary** Sequentially load variables from data EEPROM

**Declaration** VLD(variable,index)

**Return** No return value.

**Description** To load variables, starting at the pointer, use the VLD command. In the "variable" space of the command put the name of the variable and in the "index" space put the number of sequential variables to be loaded.

Group [SMP Status Commands](#)

**105. VST**

**Summary** Sequentially store variables to data EEPROM

**Declaration** VST(variable,index)

**Return** No return value.

**Description** To store a series of variables, use the VST command. In the "variable" space of the command put the name of the variable and in the "index" space put the total number of sequential variables that need to be stored. Enter a one if just the variable specified needs to be stored. The actual sizes of the variables will be recognized automatically.

Group [SMP Status Commands](#)

**106. WAIT**

**Summary** Wait (exp) sample periods

**Declaration** WAIT=exp

**Return** No return value.

**Description** There will probably be circumstances where the program execution needs to be paused for a specific period of time. Time, within the SmartMotor, is tracked in terms of servo sample periods. It is recommended that the Unit Conversion calculator available in the software be used for getting the corresponding number from seconds. The following code would be the same as WAIT=1000, only it will allow code to be executed during the wait if it is placed between the WHILE and the LOOP.

```
CLK = 0           'Reset CLK to 0  
  
WHILE CLK
```

Group [SMP Programming Commands](#)

## 107. WHILE, LOOP

**Summary** Conditional program flow command, While structure element

**Declaration** WHILE expression, LOOP

**Return** No return value.

**Description** The most basic looping function is a WHILE command. The WHILE is followed by an expression that determines whether the code between the WHILE and the following LOOP command will execute or be passed over. While the expression is true, the code will execute. An expression is true when it is non-zero. If the expression results in a "zero" then it is false. The following is an example of a valid WHILE loop which will execute ten times.

```
a = 1  
  
WHILE a < 10  
    a = a + 1  
  
LOOP
```

The task or tasks within the WHILE loop will execute as long as the function remains true. The BREAK command can be used to break out of a WHILE loop, although that somewhat compromises the elegance of a WHILE statement's single test point, making the code a little harder to follow. The BREAK command should be used sparingly or preferably not at all in the context of a WHILE.

**Group** [SMP Programming Commands](#)

## 108. X

**Summary** Decelerate to stop

**Declaration** X

**Return** No return value.

**Description** If the X command is issued while a move is in progress it will cause the motor to decelerate to a stop at the last entered A= value. When the motor comes to rest it will servo in place until commanded to move again. The X command works in both Position and Velocity modes.

**Group** [SMP Motion Commands](#)

## 109. Z

**Summary** Total system reset

**Declaration**

**Return** No return value.

**Description**

Group [SMP Status Commands](#)

**110. Za**

**Summary** Reset current limit violation latch bit

**Declaration**

**Return** No return value.

**Description**

## eCylinder/eRotary SMP Commands Reference

Following are the SMP Commands which can be used in a Smart Motor Program (SMP). They are arranged in [related groups](#) and in [alphabetic order](#) for easy access.

---

### SMP Commands in Related Groups

The SMP Commands are categorized in each group depending on their functionalities.

- **SMP Motion Commands**

These commands are responsible for the motion of a SmartMotor in various modes.

- [ACC](#)
  - [al](#)
  - [MODE](#)
  - [VEL](#)
- 

### SMP Commands in Alphabetic Order

1. [ACC](#)
  2. [al](#)
  3. [MODE](#)
  4. [VEL](#)
- 

### SMP Commands

[note: *In the command description shown below, # is an Integer number*]

#### 1. ACC

**Summary** Set absolute acceleration for the specified index position.

**Declaration** ACC[index]=expression

**Return** No return value.

**Description** Acceleration must be a positive integer > 0. The default is zero forcing something to be entered to get motion. A typical value is 100. If left unchanged, while the motor is moving, this value will not only determine acceleration but also deceleration which will form a triangular or trapezoidal velocity motion profile. This value can be changed at any time. The value set does not get acted upon until the next [G](#) command is sent.

Group [SMP Motion Commands](#)

## 2. al

**Summary** Set position for the specified index position.

**Declaration** al[index]=expression

**Return** No return value.

**Description** The command sets an absolute end position. The units are encoder counts and can be positive or negative. The end position can be set or changed at any time during or at the end of previous moves.

Group [SMP Motion Commands](#)

## 3. MODE

**Summary** Set mode for the specified index position.

**Declaration** MODE[index]=expression

**Return** No return value.

**Description** The command sets either absolute (default) or relative mode for the position. If a given position has absolute mode then the motor moves to the specified position. If a given position has relative mode then the motor moves relative to the current position by incremental distance equal to the specified position.

Group [SMP Motion Commands](#)

## 4. VEL

**Summary** Set maximum permitted velocity for the specified index position.

**Declaration** VEL[index]=expression

**Return** No return value.

**Description** Use the VEL command to set a limit on the velocity the motor can accelerate to. That limit becomes the slew rate for all trajectory based motion. The value defaults to zero so it must be set before any motion can take place. The new value does not take effect until the next G command is issued.

Group [SMP Motion Commands](#)
